Note

Before using this information and the product it supports, read the general information in Appendix B “Notices” on page 897, the Warranty Information document, and the Safety Information and the Environmental Notices and User Guide documents on the Lenovo Documentation CD.

Läs säkerhetsinformationen innan du installerar den här produkten.

Safety statements

These statements provide the caution and danger information that is used in this documentation.

Important: Each caution and danger statement in this documentation is labeled with a number. This number is used to cross reference an English-language caution or danger statement with translated versions of the caution or danger statement in the Safety Information document.

For example, if a caution statement is labeled Statement 1, translations for that caution statement are in the Safety Information document under Statement 1.

Be sure to read all caution and danger statements in this documentation before you perform the procedures. Read any additional safety information that comes with your system or optional device before you install the device.

Statement 1
DANGER

Electrical current from power, telephone, and communication cables is hazardous.

To avoid a shock hazard:

• Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.
• Connect all power cords to a properly wired and grounded electrical outlet.
• Connect to properly wired outlets any equipment that will be attached to this product.
• When possible, use one hand only to connect or disconnect signal cables.
• Never turn on any equipment when there is evidence of fire, water, or structural damage.
• Disconnect the attached power cords, telecommunications systems, networks, and modems before you open the device covers, unless instructed otherwise in the installation and configuration procedures.
• Connect and disconnect cables as described in the following table when installing, moving, or opening covers on this product or attached devices.

<table>
<thead>
<tr>
<th>To Connect:</th>
<th>To Disconnect:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Turn everything OFF.</td>
<td>1. Turn everything OFF.</td>
</tr>
<tr>
<td>2. First, attach all cables to devices.</td>
<td>2. First, remove power cords from outlet.</td>
</tr>
<tr>
<td>3. Attach signal cables to connectors.</td>
<td>3. Remove signal cables from connectors.</td>
</tr>
<tr>
<td>4. Attach power cords to outlet.</td>
<td>4. Remove all cables from devices.</td>
</tr>
<tr>
<td>5. Turn device ON.</td>
<td></td>
</tr>
</tbody>
</table>

Statement 2

CAUTION:
When replacing the lithium battery, use only Part Number 33F8354 or an equivalent type battery recommended by the manufacturer. If your system has a module containing a lithium battery, replace it only with the same module type made by the same manufacturer. The battery contains lithium and can explode if not properly used, handled, or disposed of. Do not:

• Throw or immerse into water
• Heat to more than 100°C (212°F)
• Repair or disassemble

Dispose of the battery as required by local ordinances or regulations.

Statement 12

CAUTION:
The following label indicates a hot surface nearby.

Statement 21

CAUTION:
Hazardous energy is present when the blade is connected to the power source. Always replace the blade cover before installing the blade.

UL regulatory information
This device is for use only with Listed chassis.
Chapter 1. Introduction

The Lenovo Flex System x440 Compute Node Types 7167 and 2590 is a high-availability, scalable compute node that is optimized to support the next-generation microprocessor technology and is ideally suited for medium and large businesses.

The x440 Compute Node Types 7167 and 2590 is supported in the Flex System Enterprise Chassis only.

This documentation provides the following information about setting up and troubleshooting the compute node:
- Starting and configuring the compute node
- Installing the operating system
- Diagnosing problems
- Installing, removing, and replacing components

Packaged with the compute node are software CDs that help you configure hardware, install device drivers, and install the operating system.

To download the latest firmware and device drivers, go to http://www.ibm.com/support/fixcentral and select PureSystems, PureFlex System, Compute Node and x440 Compute Node.

The compute node comes with a limited warranty. For information about the terms of the warranty and getting service and assistance, see the Lenovo Warranty Information document for your compute node. This document is available on the Lenovo Documentation CD.

You can obtain up-to-date information about the compute node at http://www.ibm.com/systems.

The compute node might have features that are not described in the documentation that comes with the compute node. The documentation might be updated occasionally to include information about those features. Technical updates might also be available to provide additional information that is not included in the compute node documentation. To obtain the most up-to-date documentation for this product, go to http://pic.dhe.ibm.com/infocenter/flexsys/information/index.jsp.

You can subscribe to information updates that are specific to your compute node at http://www.ibm.com/support/mynotifications.

The model number and serial number are on the ID label on the bezel on the front of the compute node, and on a label on the bottom of the compute node that is visible when the compute node is not in the Flex System chassis. If the compute node comes with an RFID tag, the RFID tag covers the ID label on the bezel on the front of the compute node but you can open the RFID tag to see the ID label behind it.

Note: The illustrations in this document might differ slightly from your hardware.
Related documentation

Use this information to identify and locate related compute node documentation.

This Installation and Service Guide contains general information about the compute node, including how to install supported optional devices and how to configure the compute node. It also contains information to help you solve problems yourself and instructions for removing and installing components, and it contains information for service technicians. Documents that are in Portable Document Format (PDF) are on the documentation CD that comes with your product. The following documentation is also available.

- **Safety Information**
  This document is in PDF. It contains translated caution and danger statements. Each caution and danger statement that appears in the documentation has a number that you can use to locate the corresponding statement in your language in the Safety Information document.

- **Lenovo Warranty Information**
  This printed document contains the warranty terms and a pointer to the Lenovo Statement of Limited Warranty.

- **Environmental Notices and User Guide**
  This document is in PDF. It contains translated environmental notices.

- **License Agreement for Machine Code**
  This document is in PDF. It provides translated versions of the License Agreement for Machine code for your compute node.

- **Licenses and Attributions Document**
  This document is in PDF. It provides information about the open-source notices.

In addition to the documentation in this library, be sure to review the Installation and Service Guide for your Flex System chassis for information to help you prepare for system installation and configuration.

To check for updated documentation, go to [http://www.lenovo.com/support](http://www.lenovo.com/support).

You can also find documentation that is related to Flex System products at [http://pic.dhe.ibm.com/infocenter/flexsys/information/index.jsp](http://pic.dhe.ibm.com/infocenter/flexsys/information/index.jsp).
Brocade documentation

Use this information to identify and locate related Brocade documentation.

The following section introduces Brocade documents that you might find useful for the installation and administration.

- **EN4023 User Guide**

- **FC5022 User Guide**

---

The Lenovo Documentation CD

The documentation CD contains documentation for the compute node in Portable Document Format (PDF). It includes a documentation browser to help you find information quickly.

You can run the documentation CD on any computer that meets the hardware and software requirements.

**Hardware and software requirements**

Use this information to determine the minimum hardware and software requirements.

The Lenovo *Documentation* CD requires the following minimum hardware and software:

- Microsoft Windows
- 100 MHz microprocessor
- 32 MB of RAM
- Adobe Acrobat Reader 3.0 (or later) or xpdf, which comes with Linux operating systems

**Using the Documentation Browser**

Use this information to start the Documentation Browser.

Use the Documentation Browser to browse the contents of the CD, read brief descriptions of the documents, and view documents, using Adobe Acrobat Reader or xpdf. The Documentation Browser automatically detects the regional settings in use in your system and displays the documents in the language for that region (if available). If a document is not available in the language for that region, the English-language version is displayed.

Use one of the following procedures to start the Documentation Browser:
If Autostart is enabled, insert the CD into the CD or DVD drive. The Documentation Browser starts automatically.

If Autostart is disabled or is not enabled for all users, use one of the following procedures:

– If you are using a Windows operating system, insert the CD into the CD or DVD drive and click Start → Run. In the Open field, type
e:\win32.bat
where e is the drive letter of the CD or DVD drive, and click OK.
– If you are using Red Hat Linux, insert the CD into the CD or DVD drive; then, run the following command from the /mnt/cdrom directory:
  sh runlinux.sh

Select the compute node from the Product menu. The Available Topics list displays all the documents for the compute node. Some documents might be in folders. A plus sign (+) indicates each folder or document that has additional documents under it. Click the plus sign to display the additional documents.

When you select a document, a description of the document is displayed under Topic Description. To select more than one document, press and hold the Ctrl key while you select the documents. Click View Book to view the selected document or documents in Acrobat Reader or xpdf. If you selected more than one document, all the selected documents are opened in Acrobat Reader or xpdf.

To search all the documents, type a word or word string in the Search field and click Search. The documents in which the word or word string appears are listed in order of the most occurrences. Click a document to view it. Press Ctrl+F to use the Acrobat search function, or press Alt+F to use the xpdf search function within the document.

Click Help for detailed information about using the Documentation Browser.

---

**Notices and statements in this document**

Use this information to understand the most common documentation notices and statements and how they are used.

The caution and danger statements in this document are also in the multilingual Safety Information document, which is on the documentation CD. Each statement is numbered for reference to the corresponding statement in the Safety Information document.

The following notices and statements are used in this document:

- **Note:** These notices provide important tips, guidance, or advice.
- **Important:** These notices provide information or advice that might help you avoid inconvenient or problem situations.
- **Attention:** These notices indicate possible damage to programs, devices, or data. An attention notice is placed just before the instruction or situation in which damage might occur.
- **Caution:** These statements indicate situations that can be potentially hazardous to you. A caution statement is placed just before the description of a potentially hazardous procedure step or situation.
- **Danger:** These statements indicate situations that can be potentially lethal or hazardous to you. A danger statement is placed just before the description of a potentially lethal or hazardous procedure step or situation.
Features and specifications

Use this information to view specific information about the compute node, such as compute node hardware features and the dimensions of the compute node.

Notes:

1. Power, cooling, and chassis systems management are provided by the Flex System chassis.
2. The operating system in the compute node must provide USB support for the compute node to recognize and use USB media drives and devices.

The following table is a summary of the features and specifications of the x440 Compute Node Types 7167 and 2590.
## Features and specifications

<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Microprocessor:</strong></td>
<td>One, two or four multi-core Intel Xeon microprocessors.</td>
</tr>
<tr>
<td><strong>Notes:</strong></td>
<td>1. Use the Setup utility to determine the type and speed of the microprocessors in the compute node. 2. Configurations with three installed microprocessors are not supported.</td>
</tr>
<tr>
<td><strong>Integrated functions:</strong></td>
<td>- Renesas SH7757 (IMM2) baseboard management controller (BMC) with integrated VGA controller  - (Models with LAN-on-motherboard (LOM) only) Two LOM Periscope connectors  - (Models with LOM only) Two Emulex BE3 dual-port 10 Gigabit Ethernet controller  - Support for up to two internal USB ports  - One external USB port  - One LSI 2004 SAS controller with support for RAID level-0 or RAID level-1  - Light path diagnostics  - Automatic server restart (ASR)  - One Xilinx Spartan 6 Field Programmable Gate Array (FPGA)  - Four Fabric Mezzanine connectors  - Concurrent keyboard/video/mouse (cKVM)  - Serial over LAN (SOL)  - Wake on LAN (WOL)</td>
</tr>
<tr>
<td><strong>Upgradeable firmware:</strong></td>
<td>All firmware is field upgradeable.</td>
</tr>
<tr>
<td><strong>Security:</strong></td>
<td>Fully compliant with NIST 800-131A. The security cryptography mode set by the managing device (CMM, Lenovo XClarity Administrator or Flex System Manager management node) determines the security mode in which the compute node operates.</td>
</tr>
<tr>
<td><strong>Memory:</strong></td>
<td>- 48 dual inline memory module (DIMM) connectors  - Type: Low-profile (LP) double-data rate (DDR3) DRAM  - Supports 4 GB, 8 GB, 16 GB and 32 GB DIMMs with up to 1536 GB of total memory on the system board  - Support for RDIMMs, LRDIMMs, and UDIMMs (combining is not supported)</td>
</tr>
<tr>
<td><strong>Predictive Failure Analysis (PFA) alerts:</strong></td>
<td>- Microprocessors  - Memory  - Hard disk drives</td>
</tr>
<tr>
<td><strong>Drives:</strong></td>
<td>Supports up to two hot-swap, small form factor (SFF) Serial Attached SCSI (SAS) or Serial ATA (SATA) hard disk drives.</td>
</tr>
<tr>
<td><strong>Size:</strong></td>
<td>- Height: 55.5 mm (2.19 in)  - Depth: 492.7 mm (19.4 in)  - Width: 435.3 mm (17.14 in)  - Maximum weight: 12.25 kg (27 lbs)</td>
</tr>
<tr>
<td><strong>Environment:</strong></td>
<td>The x440 Compute Node Types 7167 and 2590 complies with ASHRAE class A3 specifications.  - Power on¹:  - Temperature: 5°C - 40°C (41°F - 104°F) up to 950m (3,117 ft)  - Humidity, non-condensing: -12°C dew point (10.4°F) and 8% - 85% relative humidity²,³  - Maximum dew point: 24°C (75°F)  - Maximum altitude: 3048 m (10,000 ft)  - Maximum rate of temperature change: 5°C/hr (41°F/hr)⁴  - Power off²:  - Temperature: 5°C to 45°C (41°F - 113°F)  - Relative humidity: 8% - 85%  - Maximum dew point: 27°C (80.6°F)  - Storage (non-operating):  - Temperature: 1°C to 60°C (33.8°F - 140°F)  - Altitude: 3050 m (10,006 ft)  - Relative humidity: 5% - 80%  - Maximum dew point: 29°C (84.2°F)  - Shipment (non-operating)⁷:  - Temperature: -40°C to 60°C (-40°F - 140°F)  - Altitude: 10,700 m (35,105 ft)  - Relative humidity: 5% - 100%  - Maximum dew point: 29°C (84.2°F)⁸  - Particulate contamination</td>
</tr>
</tbody>
</table>

---

1. Compute Node powered on.
### Table 1. Features and specifications (continued)

<table>
<thead>
<tr>
<th>Features and specifications</th>
</tr>
</thead>
<tbody>
<tr>
<td>2. Compute Node is removed from original shipping container and is installed but not in use, for example, during repair, maintenance, or upgrade.</td>
</tr>
<tr>
<td>3. A3 - Derate maximum allowable temperature 1°C/175 m above 950 m. At maximum altitude of 3,050m (10kft) maximum air temperature is 28°C (82°F)</td>
</tr>
<tr>
<td>4. 5°C/hr for data centers employing tape drives and 20°C/hr for data centers employing disk drives.</td>
</tr>
<tr>
<td>5. The minimum humidity level for class A3 is the higher (more moisture) of the -12°C dew point and the 8% relative humidity. These intersect at approximately 25°C. Below this intersection (-25°C), the dew point (-12°C) represents the minimum moisture level; above the intersection, relative humidity (8%) is the minimum.</td>
</tr>
<tr>
<td>6. Moisture levels lower than 0.5°C DP, but not lower -10°C DP or 8% relative humidity, can be accepted if appropriate control measures are implemented to limit the generation of static electricity on personnel and equipment in the data center. All personnel and mobile furnishings and equipment must be connected to ground via an appropriate static control system. The following items are considered the minimum requirements:</td>
</tr>
<tr>
<td>a. Conductive materials (conductive flooring, conductive footwear on all personnel who go into the数据中心; all mobile furnishings and equipment will be made of conductive or static dissipative materials).</td>
</tr>
<tr>
<td>b. During maintenance on any hardware, a properly functioning wrist strap must be used by any personnel who contacts IT equipment.</td>
</tr>
<tr>
<td>7. The equipment acclimation period is 1 hour per 20°C of temperature change from the shipping environment to the operating environment.</td>
</tr>
<tr>
<td>8. Condensation is acceptable, but not rain.</td>
</tr>
<tr>
<td>9. The fully configured chassis weight is based on all nodes and I/O modules being at their maximum design limit.</td>
</tr>
</tbody>
</table>

### What your compute node offers

Your compute node offers features such as the integrated management module 2, hard disk drive support, systems-management support, microprocessor technology, integrated network support, I/O expansion, large system-memory capacity, light path diagnostics LEDs, PCI Express, and power throttling.

- **Features on Demand**
  
  If a Features on Demand feature is integrated in the compute node or in an optional device that is installed in the compute node, you can purchase an activation key to activate the feature. For information about Features on Demand, see [https://fod.lenovo.com/lkms](https://fod.lenovo.com/lkms).

- **Dynamic System Analysis (DSA)**
  
  Dynamic System Analysis (DSA) collects and analyzes system information to aid in diagnosing compute node problems. DSA collects the following information about the compute node:
  
  - Drive health information
  - Event logs for ServeRAID controllers and service processors
  - Hardware inventory, including PCI and USB information
  - Installed applications and hot fixes
  - Kernel modules
  - Light path diagnostics status
  - Network interfaces and settings
  - Performance data and details about processes that are running
  - RAID and controller configuration
  - Integrated management module 2 status and configuration
  - System configuration
Vital product data and firmware information

DSA creates a DSA log, which is a chronologically ordered merge of the system-event log (as the IPMI event log), the IMM event log (as the ASM event log), and the operating-system event logs. You can send the DSA log as a file to a support representative or view the information as a text file or HTML file.

For more information, see “Lenovo Dynamic System Analysis Preboot diagnostic program” on page 65.

- **Flexible network support**
  The compute node provides flexible network capabilities:
  - **Models without embedded virtual fabric:** The compute node has connectors on the system board for optional expansion adapters for adding network communication capabilities to the compute node. You can install up to two I/O expansion adapters for network support. This provides the flexibility to install expansion adapters that support a variety of network communication technologies.

- **Hard disk drive support**
  The compute node supports up to two hot-swap hard disk drives. You can implement RAID 0 or RAID 1 for the drives.

- **LenovoServerGuide Setup and Installation CD**
  The ServerGuide Setup and Installation CD, which you can download from the web, provides programs to help you set up the compute node and install a Windows operating system. The ServerGuide program detects installed optional hardware devices and provides the correct configuration programs and device drivers. For more information, see “Using the ServerGuide Setup and Installation CD” on page 40.

- **Integrated management module II (IMM2)**
  The integrated management module II (IMM2) combines systems-management functions, video controller, the remote presence, and blue-screen capture features in a single chip. The IMM2 provides advanced systems-management control, monitoring, and alerting function. If an environmental condition exceeds a threshold or if a system component fails, the IMM2 lights LEDs to help you diagnose the problem, records the error in the IMM event log, and alerts you to the problem.

  Optionally, the IMM2 also provides a virtual presence capability for remote systems management capabilities. The IMM2 provides remote systems management through industry-standard interfaces:
  - Common Information Model (CIM)
  - Intelligent Platform Management Interface (IPMI) version 2.0
  - Simple Network Management Protocol (SNMP) version 3.0
  - Web browser

  For more information, see Chapter 4 “Accessing the IMM2” on page 43.

- **Large system-memory capacity**
  The compute node supports up to 1536 GB of system memory. The memory controller provides support for up to 48 industry-standard registered ECC DDR3 on low-profile (LP) DIMMs on the system board. For the most current list of supported DIMMs, see [http://www.lenovo.com/serverproven/](http://www.lenovo.com/serverproven/).

- **Light path diagnostics**
  Light path diagnostics provides light-emitting diodes (LEDs) to help you diagnose problems. For more information, see “Light path diagnostics” on page 57.

- **Microprocessor technology**
  The compute node supports up to four multi-core Intel Xeon microprocessors. For more information about supported microprocessors and their part numbers, see Chapter 5 “Parts listing, Types 7167 and 2590” on page 51.

**Note:** The optional microprocessors are limited by the capacity and capability of the compute node. Any microprocessor that you install must have the same specifications as the microprocessor that came with the compute node.

8 Lenovo Flex System x440 Compute Node Installation and Service Guide
• **PCI Express**
  PCI Express is a serial interface that is used for chip-to-chip interconnect and expansion adapter interconnect. You can add optional I/O and storage devices.

• **Power throttling**
  By enforcing a power policy known as power-domain oversubscription, the Flex System chassis can share the power load between two or more power supply modules to ensure sufficient power for each device in the Flex System chassis. This policy is enforced when the initial power is applied to the Flex System chassis or when a compute node is inserted into the Flex System chassis.

  The following settings for this policy are available:
  – Basic power management
  – Power module redundancy
  – Power module redundancy with compute node throttling allowed

• **Systems-management support**
  The compute node IMM2 provides a Web interface for remote systems-management support. You can use the interface to view system status, and control server management functions and IMM management settings.

  The IMM2 communicates with the Flex System Chassis Management Module (CMM) and the Lenovo XClarity Administrator or Flex System Manager management software (if available).
  – The Lenovo XClarity Administrator is a virtual appliance that you can use to manage Flex System chassis in a secure environment. The Lenovo XClarity Administrator provides a central interface to perform the following functions for all managed endpoints:
    – User management
    – Hardware monitoring and management
    – Configuration management
    – Operating system deployment
    – Firmware management

    For more information, see https://support.lenovo.com/us/en/documents/LNVO-XCLARITY.
  – Flex System Manager management software is a platform-management foundation that streamlines the way you manage physical and virtual systems in a heterogeneous environment. By using industry standards, Flex System Manager management software supports multiple operating systems and virtualization technologies. For more information, see .

• **Lenovo XClarity Administrator**
  Lenovo XClarity Administrator is a centralized resource-management solution that enables administrators to deploy infrastructure faster and with less effort. The solution seamlessly integrates into System x, ThinkServer, and NeXtScale servers, as well as the Flex System converged infrastructure platform.

  Lenovo XClarity Administrator provides:
  – Automated discovery
Agent-free hardware management

Monitoring

Firmware updates and compliance

Pattern-based configuration management

Deployment of operating systems and hypervisors

Administrators are able to find the right information and accomplish critical tasks faster through an uncluttered, dashboard-driven graphical user interface (GUI). Centralizing and automating foundational infrastructure deployment and lifecycle management tasks across large pools of systems frees up administrator time, and makes resources available to end-users faster.

Lenovo XClarity is easily extended into the leading virtualization management platforms from Microsoft and VMware using software plug-ins, called Lenovo XClarity Integrators. The solution improves workload uptime and service-level assurance by dynamically relocating workloads from affected hosts in the cluster during rolling server reboots or firmware updates, or during predicted hardware failures.

### Installing Lenovo XClarity Administrator

- **Installing Lenovo XClarity Administrator for the first time**

  The initial setup of Lenovo XClarity Administrator involves preparing the network, installing and configuring the Lenovo XClarity Administrator virtual appliance, managing systems, and optionally setting up automatic problem notification.

  There are a number of different ways to connect manageable systems to the network and to set up the Lenovo XClarity Administrator to manage those systems based on the network topology that is implemented in your environment. For guidance for installing the Lenovo XClarity Administrator in VMware ESXi-based and Hyper-V environments, see [http://pic.dhe.ibm.com/infocenter/flexsys/information/index.jsp?topic=%2Fcom.lenovo.lxca.doc%2Fsetup.html](http://pic.dhe.ibm.com/infocenter/flexsys/information/index.jsp?topic=%2Fcom.lenovo.lxca.doc%2Fsetup.html).

- **Free 90-day trial**

  Lenovo XClarity Administrator offers a free, 90-day trial license that enables you to use all available features (including operating-system deployment, firmware maintenance, and configuration management) for a limited time.

  After 90 days, you can continue to use Lenovo XClarity Administrator to manage and monitor your hardware for free; however, you must purchase a full-function-enablement license to continue using Lenovo XClarity Administrator to configure your hardware using Configuration Patterns and to deploy operating systems. You can purchase Lenovo XClarity Administrator licenses from your Lenovo seller or business partner.

- **Updating Lenovo XClarity Administrator**

Lenovo XClarity Administrator

Lenovo XClarity Administrator is a centralized, resource-management solution that simplifies infrastructure management, speeds responses, and enhances the availability of Lenovo® server systems and solutions. It runs as a virtual appliance that automates discovery, inventory, tracking, monitoring, and provisioning for Lenovo servers, Flex System servers, and RackSwitch switches in a secure environment.

Lenovo XClarity Administrator provides a central interface to perform the following functions for all managed endpoints.

- **Hardware management**
  Lenovo XClarity Administrator provides agent-free hardware management. It can automatically discover manageable endpoints, including Flex System chassis and components, System x, NeXtScale, and ThinkServer servers, and RackSwitch switches. Inventory of the discovered endpoints is also gathered, so an at-a-glance view of the managed hardware inventory and status is possible.

- **Hardware monitoring**
  Lenovo XClarity Administrator provides a centralized view of all events and alerts that are generated from the managed endpoints. When a CMM or IMM detects an issue, an alert or event is passed to the Lenovo XClarity Administrator and is displayed in the events or alerts log. A summary of all alerts and events is visible from the Dashboard and the Status bar. Events and alerts for a specific endpoint are available from the Alerts and Events detail page for that endpoint.

- **Operating-system deployment**
  You can use Lenovo XClarity Administrator to manage the repository of operating-system images and deploy operating-system images to managed servers.

- **Configuration management**
  You can quickly provision and pre-provision all of your servers using a consistent configuration. Configuration settings (such as local storage, I/O adapters, boot settings, firmware, ports, and IMM and UEFI settings) are saved as a server pattern that can be applied to one or more managed servers. When the server patterns are updated, the changes are automatically deployed to the applied servers.

- **Firmware compliance and updates**
  Firmware management is simplified by assigning firmware-compliance policies to managed endpoints. When you create and assign a compliance policy to managed endpoints, Lenovo XClarity Administrator monitors changes to the inventory for those endpoints and flags any endpoints that are out of compliance.

- **User management**
  Lenovo XClarity Administrator provides a centralized authentication server to create and manage user accounts and to manage and authenticate user credentials. The authentication server is created automatically when you start the management server for the first time. The user accounts that you create for Lenovo XClarity Administrator are also used to log in to managed chassis and servers.

- **Security**
  If your environment must comply with either NIST SP 800-131A or FIPS 140-2 standards, Lenovo XClarity Administrator can help you achieve a fully compliant environment. It supports self-signed SSL certificates (which are issued by an internal certificate authority) and external SSL certificates (which are issued by a private or commercial CA). Firewalls on chassis and servers can be configured to accept incoming requests from only Lenovo XClarity Administrator.

- **Service and support**
  Lenovo XClarity Administrator can be set up to collect and send diagnostic files automatically to your preferred service provider when certain serviceable events occur in Lenovo XClarity Administrator and the managed endpoints. You can choose to send diagnostic files to Lenovo Support using call home or to
another service provider using SFTP. You can also manually collect diagnostic files, open a problem
record, and send diagnostic files to the Lenovo Support Center.

- **Task automation using scripts**
  Lenovo XClarity Administrator can be integrated into external, higher-level management and automation
  platforms through open REST application programming interfaces (APIs). Using the REST APIs, Lenovo
  XClarity Administrator can easily integrate with your existing management infrastructure. You can also run
  Lenovo XClarity cmdlets in a Microsoft PowerShell session to automate certain management functions.
  The cmdlets use Lenovo XClarity Administrator REST APIs and can automate functions.

- **Integration with other management software**
  Lenovo XClarity Administrator is available stand-alone or as a bundled offering that is known as Lenovo
  XClarity Pro. Lenovo XClarity Pro is composed of the base Administrator product plus two Lenovo XClarity
  Integrator modules that provide integration into Microsoft Systems Center or VMware vCenter. Together,
  these tools provide discovery, monitoring, configuration, and management functions to reduce the cost
  and complexity of routine system administration for System x, NeXtScale, and Flex System endpoints.

---

**Reliability, availability, and serviceability features**

Three of the most important features in compute node design are reliability, availability, and serviceability
(RAS). These RAS features help to ensure the integrity of the data that is stored in the compute node, the
availability of the compute node when you need it, and the ease with which you can diagnose and correct
problems.

The compute node has the following RAS features:

- 24-hour support center
- Advanced Configuration and Power Interface (ACPI)
- Automatic server restart (ASR)
- Built-in diagnostics using DSA Preboot
- Built in monitoring for temperature, voltage, and hard disk drives
- Customer support center 24 hours per day, 7 days a week
- Customer upgrade of flash ROM-resident code and diagnostics
- Customer-upgradeable Unified Extensible Firmware Interface (UEFI) code and diagnostics
- ECC protected DDR3 DIMMs
- ECC protection on the L2 cache
- Error codes and messages
- Integrated management module II (IMM2) that communicates with the Chassis Management Module to
  enable remote systems management
- Light path diagnostics
- Memory mirroring mode support
- Microprocessor built-in self-test (BIST) during power-on self-test (POST)
- Microprocessor Intel QuickPath Interconnect bus and CRC checking
- Microprocessor serial number access
- PCI bus even parity checking
- POST
- Power policy
- Processor presence detection
- Rank-sparing mode support
- ROM-resident diagnostics

---

1. Service availability varies by country. Response time varies depending on the number and nature of incoming calls.
- System-error logging
- Vital product data (VPD) on memory
- Wake on LAN capability
- Wake on PCI (PCIe Expansion Node) capability

**Major components of the compute node**

Use this information to locate the major components on the compute node. The major components of the compute node include field replaceable units (FRUs), customer replaceable units (CRUs), and optional devices.

The following illustration shows the major components of the compute node.

![Illustration of compute node components](image)

**Power, controls, and indicators**

Use this information to view power features, turn on and turn off the compute node, and view the functions of the controls and indicators.

**Compute node controls, connectors, and LEDs**

Use this information for details about the controls, connectors, and LEDs.

The following illustration identifies the buttons, connectors, and LEDs on the control panel.
Fault LED

When this yellow LED is lit, it indicates that a system error has occurred in the compute node. In addition, the fault LED on the chassis system LED panel is lit. You can check the CMM event log to determine the source of the condition. For more information, see “Viewing event logs without restarting the compute node” on page 63. See also “Light path diagnostics LEDs” on page 59 for more information about the LEDs on the compute node.

The fault LED turns off only after the error is corrected.

**Note:** When the fault LED turns off, you should also clear the IMM event log. Use the Setup utility to clear the IMM event log.

Check log LED

When this yellow LED is lit, it indicates that a condition that causes an event to be logged in the event log has occurred. To view the IMM2 event log see “IMM event log” on page 63

The check log LED can be turned off through the CMM **led** command, the CMM web interface, the Lenovo XClarity Administrator (if available), or the Flex System Manager management software (if available).

- For more information about the CMM **led** command, see the .
- For more information about the Flex System Manager management software, see .

**Notes:**

2. You can check the CMM event log to determine the source of the condition. For more information, see “Viewing event logs without restarting the compute node” on page 63.

Identify LED

The system administrator can remotely light this blue LED to aid in visually locating the compute node. When this LED is lit, the identify LED on the Flex System chassis is also lit. The identify LED can be lit and turned off through the CMM **led** command, the CMM web interface, the Lenovo XClarity Administrator (if available), or the Flex System Manager management software (if available).

- For more information about the CMM **led** command, see the .

• For more information about the Flex System Manager management software, see .

### Power button/LED

When the compute node is connected to power through the Flex System chassis, press this button to turn on or turn off the compute node.

**Notes:** The power button works only if local power control is enabled for the compute node. Local power control is enabled and disabled through the CMM **power** command and the CMM web interface.

• For more information about the CMM **power** command, see the .

• From the CMM web interface, select **Compute Nodes** from the **Chassis Management** menu. For more information, see the . All fields and options are described in the CMM web interface online help.

After the compute node is removed from the chassis, press and hold this button to activate the system-board LEDs (light path diagnostics). See “Compute node controls, connectors, and LEDs” on page 13 for more information.

This button is also the power LED. This green LED indicates the power status of the compute node:

• **Flashing rapidly:** The LED flashes rapidly for one of the following reasons:
  – The compute node has been installed in a chassis. When you install the compute node, the LED flashes rapidly for up to 90 seconds while the integrated management module II (IMM2) in the compute node is initializing and synchronizing with the chassis management module.
  – Power permissions have not been assigned to the compute node through the Chassis Management Module.
  – The Flex System chassis does not have enough power to turn on the compute node.
  – The IMM2 in the compute node is not communicating with the Chassis Management Module.
• **Flashing slowly:** The compute node is connected to power through the Flex System chassis and is ready to be turned on.
• **Lit continuously:** The compute node is connected to power through the Flex System chassis and is turned on.

When the compute node is on, pressing this button causes an orderly shutdown of the compute node so that it can be removed safely from the chassis. This includes shutting down the operating system (if possible) and removing power from the compute node.

If an operating system is running, you might have to press the button for approximately 4 seconds to initiate the shutdown.

**Attention:** Pressing the button for 4 seconds forces the operating system to shut down immediately. Data loss is possible.

### NMI button

The NMI button is recessed and can be accessed only by using a small pointed device. Pressing this button causes a nonmaskable interrupt for debugging purposes.

### KVM connector
Connect the console breakout cable to this connector (see “Console breakout cable” on page 16 for more information).

**USB connector**
Connect a USB device to this connector.

**Console breakout cable**
Use this information for details about the console breakout cable.

Use the console breakout cable to connect external I/O devices to the compute node. The console breakout cable connects through the KVM connector (see “Compute node controls, connectors, and LEDs” on page 13). The console breakout cable has connectors for a display device (video), two USB connectors for a USB keyboard and mouse, and a serial interface connector.

The following illustration identifies the connectors and components on the console breakout cable.

![Console Breakout Cable Diagram](image)

**Turning on the compute node**
Use this information for details about turning on the compute node.

After you connect the compute node to power through the Flex System chassis, the compute node can be started in any of the following ways:

- You can press the power button on the front of the compute node (see “Compute node controls, connectors, and LEDs” on page 13) to start the compute node. The power button works only if local power control is enabled for the compute node. Local power control is enabled and disabled through the CMM `power` command and the CMM web interface.
  - For more information about the CMM `power` command, see the .

1. Wait until the power LED on the compute node flashes slowly before you press the power button. While the IMM2 in the compute node is initializing and synchronizing with the Chassis Management Module, the power LED flashes rapidly, and the power button on the compute node does not respond. This process can take approximately 90 seconds after the compute node has been installed.

2. While the compute node is starting, the power LED on the front of the compute node is lit and does not flash. See “Compute node controls, connectors, and LEDs” on page 13 for the power LED states.
• If a power failure occurs, the Flex System chassis and the compute node can be configured through the CMM power command and the CMM web interface to start automatically when power is restored.
  – For more information about the CMM power command, see the.
  – From the CMM web interface, select Compute Nodes from the Chassis Management menu. For more information, see the "Flex System Chassis Management Module: User’s Guide" at http://pic.dhe.ibm.com/infocenter/flexsys/information/topic/com.lenovo.acc.cmm.doc/cmm_user_guide.html. All fields and options are described in the CMM web interface online help.

• You can turn on the compute node through the CMM power command, the CMM web interface, the Lenovo XClarity Administrator (if available), or the Flex System Manager management software (if available).
  – For more information about the CMM power command, see the.
  – From the CMM web interface, select Compute Nodes from the Chassis Management menu. All fields and options are described in the CMM web interface online help. For more information, see the "Flex System Chassis Management Module: User’s Guide" at http://pic.dhe.ibm.com/infocenter/flexsys/information/topic/com.lenovo.acc.cmm.doc/cmm_user_guide.html.
  – For more information about the Lenovo XClarity Administrator, see https://support.lenovo.com/us/en/documents/LNVO-XCLARITY.
  – For more information about the Flex System Manager management software, see.

• You can turn on the compute node through the Wake on LAN feature. The compute node must be connected to power (the power LED is flashing slowly) and must be communicating with the Chassis Management Module. The operating system must support the Wake on LAN feature, and the Wake on LAN feature must be enabled through the Chassis Management Module interface.

Turning off the compute node

Use this information for details about turning off the compute node.

When you turn off the compute node, it is still connected to power through the Flex System chassis. The compute node can respond to requests from the IMM2, such as a remote request to turn on the compute node. To remove all power from the compute node, you must remove it from the Flex System chassis.

Before you turn off the compute node, shut down the operating system. See the operating-system documentation for information about shutting down the operating system.

The compute node can be turned off in any of the following ways:

• The compute node can turn off automatically as part of the operating system shutdown process (if this feature is supported by the operating system). See your operating-system documentation for more information.

• You can press the power button on the compute node (see “Compute node controls, connectors, and LEDs” on page 13). This starts an orderly shutdown of the operating system, if this feature is supported by the operating system.

• If the operating system stops functioning, you can press and hold the power button for more than 4 seconds to turn off the compute node.

  Attention: Pressing the power button for 4 seconds forces the operating system to shut down immediately. Data loss is possible.

• You can turn off the compute node through the CMM power command, the CMM web interface, the Lenovo XClarity Administrator (if available), or the Flex System Manager management software (if available).
  – For more information about the CMM power command, see the.

– For more information about the Flex System Manager management software, see .

---

### System-board layouts

Use this information to locate the connectors, LEDs, jumpers, and switches on the system board.

### System-board connectors

Use this information to locate compute node system-board components and connectors for optional devices.

The following illustration shows the system-board components, including connectors for user-installable optional devices, in the compute node.

---

### System-board jumpers

Use this information to locate the system-board jumpers.
The following illustration shows the locations of the jumpers on the system board.

The following table describes the function of each jumper on the system board.

<table>
<thead>
<tr>
<th>Jumper number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Force IMM Reset (J12)</td>
<td>For debug purposes only.</td>
</tr>
<tr>
<td>Low Security (J9101)</td>
<td>Three-pin jumper block. The default position are pins 2 and 3.</td>
</tr>
<tr>
<td>Trusted Platform Module (TPM) physical presence (J6)</td>
<td>Two-pin jumper. The default is no jumper. Place a jumper on pins 1 and 2 to</td>
</tr>
<tr>
<td></td>
<td>indicate a physical presence to the IMM2 TPM chip.</td>
</tr>
</tbody>
</table>

**System-board LEDs**

The following illustration shows the location of the LEDs on the system board.
System-board switches

Use this information to locate the system-board switches.

The following illustration shows the location of the switch block on the system board.
The following table describes the functions of the switches on switch block SW3.

<table>
<thead>
<tr>
<th>Switch number</th>
<th>Description</th>
<th>Switch setting</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>U52-1</td>
<td>Password override</td>
<td>The default position Open.</td>
<td>Changing this switch to the Closed position overrides the power-on password.</td>
</tr>
<tr>
<td>U52-2</td>
<td>Trusted Platform Module (TPM) physical presence</td>
<td>The default position is Open.</td>
<td>Changing this switch to the Closed position indicates a physical presence to the TPM.</td>
</tr>
<tr>
<td>U52-3</td>
<td>Real time clock (RTC) reset</td>
<td>The default position is Open.</td>
<td>Changing this switch to the Closed position resets the RTC. A momentary toggle is all that is required. To avoid excessive CMOS battery drain, do not leave this switch in the Closed position.</td>
</tr>
<tr>
<td>Switch number</td>
<td>Description</td>
<td>Switch setting</td>
<td>Definition</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------</td>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>U52-4</td>
<td>Boot backup IMM2</td>
<td>The default position is Open.</td>
<td>When the switch is in the default Open position, the compute node will boot by using the primary IMM2 firmware. When the switch is in the Closed position, the compute node will boot by using a backup of the IMM2 firmware.</td>
</tr>
<tr>
<td>U52-5</td>
<td>Boot backup UEFI</td>
<td>The default position is Open.</td>
<td>Changing this switch to the Closed position forces the compute node to boot from the backup UEFI image.</td>
</tr>
<tr>
<td>U52-6</td>
<td>IMM force update</td>
<td>The default position is Open.</td>
<td>Changing this switch to the Closed position bypasses the operational firmware image and performs a IMM firmware update, if the normal firmware update procedure results in an inoperative IMM. <strong>Note:</strong> Use this jumper only if the normal firmware update procedure fails and the operational firmware image is corrupted. Use of this jumper disables normal baseboard management controller operation.</td>
</tr>
<tr>
<td>U52-7</td>
<td>Wake on LAN (WOL) disable</td>
<td>The default position is Open.</td>
<td>Changing this switch to the Closed position disables WOL.</td>
</tr>
<tr>
<td>U52-8</td>
<td>Real time management module (RTMM) flash bypass</td>
<td>The default position is Open.</td>
<td>Changing this switch to the Closed position forces the compute node to use RTMM ROM instead of flash.</td>
</tr>
<tr>
<td>U9020-1</td>
<td>Asynchronous reset to configuration logic of FPGA</td>
<td>The default position is Open.</td>
<td>Changing this switch to the Closed position resets FPGA Configuration Logic</td>

</tbody>
</table>
Chapter 2. Configuring

Use this information to update the firmware and use the configuration utilities.

Updating firmware and device drivers

Lenovo periodically makes UEFI code, IMM2 firmware, diagnostic firmware updates, and device driver updates available for the compute node. Provisioning is the set of actions that you take to update the firmware and device drivers and install the operating system. Several tools are available to help you update the firmware and device drivers in the provisioning process.

Attention: Installing the wrong firmware or device-driver update might cause the compute node to malfunction. Before you install a firmware or device-driver update, read any readme and change history files that are provided with the downloaded update. These files contain important information about the update and the procedure for installing the update, including any special procedure for updating from an early firmware or device-driver version to the latest version.

Note: Follow the instructions in the readme file that comes with the firmware update.

• Lenovo XClarity Administrator

If a Lenovo XClarity Administrator is available, you can download, install, and manage firmware updates for managed endpoints, including chassis, compute nodes, and I/O modules. You can assign compliance policies to the managed endpoints to ensure that firmware on those endpoints remains compliant.

Note: Firmware updates can be applied to the hardware only. You cannot update device drivers using the Lenovo XClarity Administrator.

For more information about using the Lenovo XClarity Administrator, see https://support.lenovo.com/us/en/documents/LNVO-XCLARITY.

• Flex System Manager Update Manager

Flex System Manager Update Manager (if available) acquires, installs, and manages firmware and device driver updates and monitors your compute nodes to ensure that they remain current. For more information about Flex System Manager Update Manager, see http://pic.dhe.ibm.com/infocenter/flexsys/information/topic/com.ibm.acc.8731.doc/updating_firmware_and_software.html.

• UpdateXpress System Packs

UpdateXpress System Packs (UXSP) contain an integration-tested bundle of online, updateable firmware and device drivers for your compute node. The Lenovo ToolsCenter Bootable Media Creator uses UpdateXpress System Packs to update the firmware and device drivers.

Typically, use UpdateXpress System Packs to update firmware and devices drivers for a compute node that has previously been provisioned. For more information about UpdateXpress System Packs, see http://www.ibm.com/support/entry/portal/docdisplay?Indocid=SERV-XPRESS.

• Lenovo ToolsCenter Bootable Media Creator

You can use Lenovo ToolsCenter Bootable Media Creator to create bootable media that is suitable for applying firmware updates and running preboot diagnostics. Using Lenovo ToolsCenter Bootable Media Creator, you can create a single bootable image on supported media (such as CD, DVD, ISO image, USB flash drive, or set of PXE files) that bundles multiple Flex System tools and updates from UpdateXpress System Packs, which contain Windows and Linux® firmware updates.

Typically, use Lenovo ToolsCenter Bootable Media Creator for the initial setup of a compute node. For more information about the Lenovo Bootable Media Creator, see .
To provision a compute node with updated firmware and device drivers by using Lenovo ToolsCenter Bootable Media Creator and the Flex System Manager management software, complete the following steps:

1. Download Lenovo ToolsCenter Bootable Media Creator to a computer that is connected over the management network to the Flex System Manager management software that is managing the compute node.
2. Create the bootable media of firmware and device driver updates.
3. Connect to the Flex System Manager management software that is managing the Flex System chassis in which the compute node is installed.
4. From Flex System Manager Chassis Manager, select the compute node. In the Actions column, select **Remote Control**.

   **Note:** The user ID that you use to log in to Flex System Manager management software must have sufficient user permissions to manage the compute node.
5. From the Remote Control session, mount the bootable media (using Remote Media).
6. Start the compute node to boot the media and install the updates.

**Important:** To avoid problems and to maintain system performance, always make sure that the UEFI code, IMM2 firmware, and diagnostic firmware levels are consistent in all compute nodes in the Flex System chassis.

For additional information about updating firmware and device drivers, see [UEFI Compliant Firmware on System x® and BladeCenter® Servers](http://www.ibm.com/support/entry/portal/docdisplay?lndocid=MIGR-5091991) and the [Flex System Quick start guides](http://www.ibm.com/support/entry/portal/docdisplay?lndocid=MIGR-5091991) and the [Firmware Update Guides](http://www.ibm.com/support/entry/portal/docdisplay?lndocid=MIGR-5091991) (you might need to register to access this content).

---

### Recovering a UEFI image

Use this information to recover a UEFI image.

The compute node has an advanced recovery feature that automatically switches to a backup UEFI page if the UEFI code in the compute node has become damaged, such as from a power failure during an update. The flash memory of the compute node consists of a primary page and a backup page. If the UEFI code in the primary page is damaged, the integrated management module detects the error and automatically switches to the backup page to start the compute node. If this happens, a POST message **Boo t ed f rom b ack up UEF I im age** is displayed, the check log LED is lit, and an automatic BIOS recovery (ABR) condition occurs. The backup page version might not be the same as the primary page version.

You can then recover or restore the original primary page UEFI.

**Note:** Changes are made periodically to the Lenovo website. The actual procedure might vary slightly from what is described in this document.

To recover the UEFI code and restore the compute node operation to the primary page, complete the following steps:

**Step 1.** Update the UEFI code (see “Updating firmware and device drivers” on page 23).

**Step 2.** Restart the compute node.

**Step 3.** At the firmware splash screen, press F3 when prompted to restore to the primary bank. The compute node boots from the primary bank.

**Note:** The prompt to press F3 displays only if the compute node boots from the backup page due to an ABR condition.
If the attempt to flash the primary page results in the compute node not booting and the check log LED is not lit, you can manually restore the UEFI code. To manually restore the UEFI code, complete the following steps.

**Note:** If the check log LED is lit, the compute node is booting from the backup image and moving the switch to backup changes nothing.

1. Before you begin, read “Safety” on page iii and “Installation guidelines” on page 827.
2. Turn off the compute node (see “Turning off the compute node” on page 17).
3. Remove the compute node from the Flex System chassis (see “Removing a compute node from a chassis” on page 828).
4. Remove the cover (see “Removing the compute node cover” on page 836).
5. Locate the boot backup UEFI switch on the switch block and move the switch to the On position (see “System-board switches” on page 20).
6. Replace the cover and reinstall the compute node in the Flex System chassis (see “Installing the compute node cover” on page 838 and “Installing a compute node in a chassis” on page 829).
7. Update the UEFI code (see “Updating firmware and device drivers” on page 23).
8. Turn off the compute node and remove it from the Flex System chassis (see “Turning off the compute node” on page 17 and “Removing a compute node from a chassis” on page 828).
9. Remove the cover of the compute node (see “Removing the compute node cover” on page 836).
10. Locate the boot backup UEFI switch on the switch block and move the switch to the Off position (see “System-board switches” on page 20).
11. Replace the cover and reinstall the compute node in the Flex System chassis (see “Installing the compute node cover” on page 838 and “Installing a compute node in a chassis” on page 829).
12. Restart the compute node (see “Turning on the compute node” on page 16).

**Important:** If you are unable to manually restore the UEFI code after several attempts, replace the system board (see “Removing and replacing the base assembly” on page 863).

---

**Configuring the compute node**

Use this information to configure the compute node.

To perform a typical initial configuration, complete the following steps:

**Note:** To configure a compute node, you configure the IP address of the IMM through the CMM Web interface. For more information, see the.

**Step 1.** Configure the Unified Extensible Firmware Interface (UEFI) firmware for the compute node by using the Setup utility (see “Using the Setup utility” on page 26 or the Advanced Setup Utility (ASU) (see ).

For more information about firmware configuration options, see http://www.ibm.com/support/entry/portal/docdisplay?indocid=MIGR-5083207.

**Step 2.** Set the boot protocol by using the Setup utility (see “Setting the boot protocol to boot from legacy devices using the Setup utility” on page 31).

You can temporarily redefine the boot order by using the Boot Selection menu program (see “Using the Boot Selection Menu program” on page 32).

**Step 3.** Configure the RAID array.

You can install up to two hard disk drives in the compute node and implement RAID level-0 (striping) or RAID level-1 (mirror) arrays in operating systems that are listed on the ServerProven list.
For the compute node, you must configure the RAID by using the LSI Configuration Utility program (see “Using the LSI Logic Configuration Utility” on page 36).

If an optional RAID expansion adapter is installed, you can use it to control all the hard disk drives that are installed in the compute node. See the documentation that comes with the expansion adapter for information about how to configure the RAID array.

Important: You must create the RAID array before you install the operating system on the compute node.

Step 4. Configure the integrated management module II (IMM2) using either the Setup utility or the Advanced Settings Utility (ASU).

Step 5. Update the compute node firmware (see “Updating firmware and device drivers” on page 23).

Note: If the Chassis Management Module (CMM) and the compute nodes are set up to use DHCP, and the CMM loses connectivity to the network, the CMM attempts to acquire a new IP address when network connectivity is restored. The compute nodes will not attempt to acquire an IP address again; they will continue to use their original IP addresses. Therefore, if you experience network problems on compute nodes after connectivity between the CMM and the network is restored, you might have to reset the service processor on each of the compute nodes in the chassis (including the management node). See “Connectivity problems” on page 800 for more information.

After you configure the compute node, you can install the operating system and update device drivers (see Chapter 3 “Installing the operating system” on page 39 for more information).

Using the Setup utility

Use these instructions to start the Setup utility.

You can access the Setup utility remotely through the CMM web interface. From the CMM web interface, select Launch Compute Node Console. For more information, see the . All fields and options are described in the CMM web interface online help.

Note: The integrated management module II (IMM2) must have a valid IP address.

To start the Setup utility locally, complete the following steps:

Step 1. If the compute node is turned on, turn off the compute node (see “Turning off the compute node” on page 17).

Step 2. If necessary, connect a keyboard, monitor, and mouse to the console breakout cable and connect the console breakout cable to the compute node.

Step 3. Turn on the compute node (see “Turning on the compute node” on page 16).

Step 4. When the prompt Press <F1> Setup is displayed, press F1. If you have set an administrator password, you must type the administrator password to access the full Setup utility menu. If you do not type the administrator password, a limited Setup utility menu is available.

Step 5. Follow the instructions on the screen.

The following menu items are on the Setup utility main menu. Depending on the version of the Unified Extensible Firmware Interface (UEFI), some menu items might differ slightly from these descriptions.

- System Information
  Select this choice to view information about the compute node. When you make changes through other choices in the Setup utility, some of those changes are reflected in the system information; you cannot change settings directly in the system information. This choice is on the full Setup utility menu only.
– **System Summary**
Select this choice to view configuration information, including the ID, speed, and cache size of the microprocessors, machine type and model of the compute node, the serial number, the system Universally Unique Identifier (UID), and the amount of installed memory.

– **Product Data**
Select this choice to view the system-board identifier, the revision level or issue date of the firmware, the integrated management module II and diagnostics code, and the version and date.

This choice is on the full UEFI Setup utility menu only.

**System Settings**
Select this choice to view or change the compute node component settings.

– **Adapters and UEFI Drivers**
Select this choice to view information about the adapters and UEFI device drivers in the compute node.

**Note:** Before you configure a UEFI-compatible device, update the firmware for your compute node. See “Updating firmware and device drivers” on page 23 for information about how to update the firmware for your compute node.

To configure a UEFI-compatible expansion adapter, complete the following steps:
1. Select **Please refresh this page first** and press Enter.
2. Select the device driver that you want to configure, and press Enter.
3. When you have finished changing settings, press Esc to exit from the program; select **Save** to save the settings that you have changed.

– **Processors**
Select this choice to view or change the microprocessor settings.

– **Memory**
Select this choice to view or change the memory settings.

If a memory error is detected during POST or memory configuration, the compute node automatically disables the failing pair of memory connectors and continues operating with reduced memory. After the problem is corrected, you must manually enable the memory connectors. Select **System Memory Details** and use the arrow keys to highlight the pair of memory connectors that you want to enable; then, set the connectors to **Enable**.

– **Devices and I/O Ports**
Select this choice to view or change assignments for devices and input/output (I/O) ports. You can configure the remote console redirection and enable or disable integrated Ethernet controllers. If you disable a device, it cannot be configured, and the operating system cannot detect it (disabling a device is equivalent to disconnecting the device).

You can also choose to enable or disable adapter option ROM support. Disabling support can potentially improve the time it takes the compute node to start.

– **Power**
Select this choice to view or change Active Energy Manager (AEM) power capping to control power consumption and microprocessor performance states.

– **Boot Modes**
Select this choice to view or change the boot settings. You can set the boot mode and choose UEFI operating system support only, legacy (BIOS) operating system support only, or UEFI and legacy operating system support.
Note: If you select the legacy only boot mode (which makes boot time much faster), you will not be able to activate any feature on demand (FoD) keys.

– Operating Modes
Select this choice to determine operational settings, such as operating mode (acoustic, efficiency, or performance) and memory speed.

– Legacy Support
Select this choice to view or set legacy support.

Notes: In the legacy mode, the system has limited ROM space for installed options. Legacy PXE boot supports up to four network interface card (NIC) ports. If more than four NIC ports are occupied, legacy PXE boot will not be attempted on the fifth NIC port and following ports. There are two ways to enable legacy PXE boot on the desired NIC ports:
1. Prioritize the desired NIC connectors by changing the ROM execution Order.
   – The path to ROM execution Order: Main menu>System Settings>Devices and I/O Ports>Set Option ROM Execution Order
   – The path to ROM execution Order: Main menu>System Settings>Devices and I/O Ports>Set Option ROM Execution Order
2. Disable the NIC connector’s legacy option ROM that you do not use from the Enable/Disable Adapter Option ROM Support menu to prioritize the desired NIC port to be 4 functional ports.
   – The path to Enable/Disable Adapter Option ROM Support: Main menu>System Settings>Devices and I/O Ports>Enable/Disable Adapter Option ROM support

– Force Legacy Video on Boot
Select this choice to enable or disable force INT video support, if the operating system does not support UEFI video output standards. The default is Enable.

– Rehook INT
Select this choice to enable or disable devices from taking control of the boot process. The default is Disable.

– Legacy Thunk Support
Select this choice to enable or disable UEFI to interact with PCI mass storage devices that are non-UEFI compliant. The default is Enable.

– Infinite Boot Retry
Select this choice to enable or disable UEFI to infinitely retry the legacy boot order.

– Non-Planar PXE
Select this choice to enable or disable non-system-board PXE for legacy mode.

– System Security
Select this option to view or change the following system security configuration.

– Physical Presence Policy Configuration
Select this choice to choose from the following Physical Presence Policy options.
• Enable/Disable: select this option to enable/disable Physical Presence Policy. Default is Enable.
• Asserted: select this option to set Physical Presence for a duration (in minutes) or turn it off. Default is De-asserted.
• Input minutes for assertion: select this option to input a number from 0~100 which stands for the number of minutes Remote Physical Presence is asserted. Physical Presence Policy has to be enabled before this option is available.
• Refresh assert status: select this option to view the current status of asserting.
– Rollback Configuration
Select this choice to allow (enable)/forbid (disable) rolling back to an older version of UEFI. Default is Enable.

- **Secure Boot Configuration**
  Select this choice to choose from the following Secure Boot options.
  - **Enable/Disable:** select this option to enable/disable Secure Boot. Default is Disable.
  - **Secure Boot Mode:** select this option to choose a mode of Secure Boot. Default is Standard Mode.
    - **Standard Mode:** standard mode of Secure Boot.
    - **Custom Secured Boot Mode:** the following options are available in this mode:
      - **Display Secure Boot Option ROM error:** to show a list of devices in the server that are not signed for Secure Boot.
      - **PK (platform key) options:** to enroll/delete PK
      - **KEK (Key Enrollment Key) options:** to enroll/delete KEK
      - **DB (Signatures Database) options:** to enroll/delete DB
      - **DBX (Revoked Signatures Database) options:** to enroll/delete DBX
  - **Trusted Platform Module (TPM 1.2)**
    Select this choice to view or change the settings of TPM 1.2.
    - **TPM firmware version:** to view current TPM firmware version.
    - **TPM device/state:** to view current state of TPM or activate/deactivate TPM.
    - **Refresh TPM Status:** to get the current status of TPM.
    - **TPM force clear:** to force clearing TPM data.
  - **Integrated Management Module**
    Select this choice to view or change the settings for the integrated management module II (IMM2).
  - **Commands on USB Interface**
    Select this choice to specify whether the Ethernet over USB interface is enabled or disabled.
    
    Notes: This option is primarily for older operating systems that have problems with USB communications device class (CDC) Ethernet interfaces. Disabling this option will cause the following issues:
    - Online update packages will not work.
    - Updates that use Bootable Media Creator (BoMC) will not work because BoMC uses the LAN over USB interface.
    - You must install the IPMI device driver to use the Advanced Settings Utility (ASU) to change the IMM2 or UEFI configuration.
    - You cannot set the IMM2 OS loader watchdog.
  - **Network Configuration**
    Select this choice to view the system-management network interface port, IMM2 MAC address, current IMM2 IP address, and host name; define the static IMM2 IP address, subnet mask, and gateway address; specify whether to use the static IP address or have DHCP assign the IMM2 IP address; save the network changes; and reset the IMM2.
  - **Reset IMM to Defaults**
    Select this choice to restore the IMM2 to the manufacturing default settings. The IMM2 controller restarts after you restore the settings.
  - **Reset IMM**
Select this choice to restart the IMM2 controller.

- **Recovery**
  Select this choice to view or change the system recovery parameters.

- **POST Attempts**
  Select this choice to define the number of times to attempt POST before invoking the recovery procedures.

- **System Recovery**
  Select this choice to configure the recovery settings.
  
  • **POST Watchdog Timer**
    Select this choice to view or enable the POST watchdog timer.
  
  • **POST Watchdog Timer Value**
    Select this choice to view or set the POST loader watchdog timer value.
  
  • **Reboot System on NMI**
    Select this choice to enable or disable restarting the system whenever a nonmaskable interrupt (NMI) occurs. The default is **Disable**.

- **Storage**
  Select this choice to view or change the storage device settings.

- **Network**
  Select this choice to view or change the network device options, such as iSCSI.

- **Driver Health**
  Select this choice to view the health status of the controllers as reported by the device drivers. You can select to perform a repair action on a device driver.

  • **Date and Time**
    Select this choice to set the date and time for the compute node. The date is set in **month/day/year** format. The time is set in 24-hour format (**hour:minute:second**).

  This choice is on the full UEFI Setup utility menu only.

  • **Start Options**
    Select this choice to view or change the startup sequence. The startup sequence specifies the order in which the compute node checks devices to find a boot record. The compute node starts from the first boot record that it finds. If the compute node has Wake on LAN hardware and software and the operating system supports Wake on LAN functions, you can specify a startup sequence for the Wake on LAN functions. For example, you can define a startup sequence that checks for a disc in the CD or DVD drive, then checks the hard disk drive, and then checks a network adapter.

    This choice is on the full UEFI Setup utility menu only.

  • **Boot Manager**
    Select this choice to view, add, delete, or change the device boot priority, boot from a file, select a one-time boot, or reset the boot order to the default setting.

  • **System Event Logs**
    Select this choice to access the System Event Manager, where you can view the POST event log and the system-event log.

    The POST event log contains the three most recent error codes and messages that were generated during POST.
The system-event log contains POST and system management interrupt (SMI) events and all events that are generated by the baseboard management controller that is embedded in the integrated management module II.

**Important:** If the system-error LED on the front of the compute node is lit but there are no other error indications, clear the system-event log. Also, after you complete a repair or correct an error, clear the system-event log to turn off the system-error LED on the front of the compute node.

- **POST Event Viewer**
  Select this choice to enter the POST event viewer to view the UEFI diagnostic codes.

- **System Event Log**
  Select this choice to view the system-event log.

- **Clear System Event Log**
  Select this choice to clear the system-event log.

**User Security**
Select this choice to set, change, or clear passwords.

You can set, change, and delete a power-on password and an administrator password through this selection. If you set a power-on password, you must type the power-on password to complete the system startup and to have access to the Setup utility menu.

You can use any combination of up to from 6 to 20 characters (A - Z, a - z, and 0 - 9) for passwords. Keep a record of your password in a secure place.

If you forget the power-on password, you can regain access to the compute node either by removing the CMOS battery and then reinstalling it (see “Removing the CMOS battery” on page 834 and “Installing the CMOS battery” on page 835) or by using the power-on password override switch (see “System-board switches” on page 20).

**Attention:** If you set an administrator password and then forget it, there is no way to change, override, or remove it. You must replace the system board.

- **Save Settings**
  Select this choice to save the changes that you have made in the settings.

- **Restore Settings**
  Select this choice to cancel the changes that you have made in the settings and restore the previous settings.

- **Load Default Settings**
  Select this choice to cancel the changes that you have made in the settings and restore the manufacturing settings.

- **Exit Setup**
  Select this choice to exit from the Setup utility. If you have not saved the changes that you have made in the settings, you are asked whether you want to save the changes or exit without saving them.

**Setting the boot protocol to boot from legacy devices using the Setup utility**

This option disables UEFI ROMs from loading. The compute node will boot legacy mode only. Use the Setup utility to configure the boot protocol to boot from a non-UEFI legacy network device for all PXE boot attempts.

To use the Setup utility to configure the boot protocol to boot from a non-UEFI legacy network device for all PXE boot attempts, complete the following steps:
1. Connect a keyboard, monitor, and mouse to the console breakout cable and connect the console breakout cable to the compute node.
2. Turn on the compute node (see “Turning on the compute node” on page 16).
3. When the prompt Press <F1> Setup is displayed, press F1. If you have set an administrator password, you must type the administrator password to access the full Setup utility menu. If you do not type the administrator password, a limited Setup utility menu is available.
4. From the Setup utility main menu, select Boot Manager Settings.
5. Select Boot Modes; then, select Legacy Only.
6. Press Esc twice to return to the Setup utility main menu.
7. Select Save Settings and then select Exit Setup.

To use the Setup utility to configure the boot protocol to boot from a non-UEFI legacy network device, complete the following steps:
1. Connect a keyboard, monitor, and mouse to the console breakout cable and connect the console breakout cable to the compute node.
2. Turn on the compute node (see “Turning on the compute node” on page 16).
3. When the prompt Press <F1> Setup is displayed, press F1. If you have set an administrator password, you must type the administrator password to access the full Setup utility menu. If you do not type the administrator password, a limited Setup utility menu is available.
4. From the Setup utility main menu, select Boot Manager.
5. Select Add Boot Option; then, select Generic Boot Option.
7. Move the non-UEFI legacy network device to the top of the boot order.
8. Press Esc three times to return to the Setup utility main menu.
9. Select Save Settings and then select Exit Setup.

Using the Boot Selection Menu program

The Boot Selection Menu program is a built-in, menu-driven configuration utility program that you can use to temporarily redefine the first startup device without changing settings in the Setup utility.

To use the Boot Selection Menu program, complete the following steps:

Step 1. Connect a keyboard, monitor, and mouse to the console breakout cable, and connect the console breakout cable to the compute node.

Step 2. Turn on the compute node (see “Turning on the compute node” on page 16).

Step 3. Press F12 (Select Boot Device). If a bootable USB mass storage device is installed, a submenu item (USB Key/Disk) is displayed.

Step 4. Use the Up Arrow and Down Arrow keys to select an item from the Boot Selection Menu and press Enter.

The next time the compute node starts, it returns to the startup sequence that is set in the Setup utility.

Updating the Universally Unique Identifier and DMI/SMBIOS data

After the system board is replaced, you must update the Universally Unique Identifier (UUID) and DMI/SMBIOS data in the integrated management module II (IMM2) on the new system board.

You can use the Advanced Settings Utility (ASU) and any of the following access methods:
- Locally (in-band)
– Through the Keyboard Controller Style (KCS) interface
– Through the LAN over USB interface
• Remotely over a LAN

You can use the ASU under any supported operating system, or you can use the Bootable Media Creator or a Windows- or Linux-based toolkit to create bootable media that contains the ASU. For information about the ASU and instructions for downloading and unpacking the ASU code, see the Advanced Settings Utility User’s Guide.

The following sections provide instructions for updating the UUID and DMI/SMBIOS data, using the different methods for accessing the IMM2. The following conventions apply to the command syntax:
• Variables are shown in italics.
• Optional parameters are enclosed in brackets ([ ]). Do not type the brackets in the commands. If you omit an optional parameter, the default is used.
• Although the command syntax is shown in mixed case, the commands are not case sensitive.

Locally: Keyboard Controller Style (KCS)
This access method uses the IPMI/KCS interface. The IPMI driver must be installed; with some operating systems, the IPMI driver is installed by default. The ASU provides the corresponding mapping layer.

To update the UUID, in the ASU command-line interface, enter the following command:
\[ \text{asu set \, SYSTEM\_PROD\_DATA.SysInfoUUID \, uuid} \]
where \text{uuid} is the user-assigned hexadecimal value, up to 16 bytes, that identifies the compute node.

To update the DMI/SMBIOS data, complete the following steps:

Step 1. In the ASU command-line interface, enter the following command:
\[ \text{asu set \, SYSTEM\_PROD\_DATA.SysInfoProdName \, xxxxyyy} \]
where:

\text{xxxx} is the 4-digit machine type of the compute node.
\text{yyy} is the 3-digit model number of the compute node.

Step 2. Enter the following command:
\[ \text{asu set \, SYSTEM\_PROD\_DATA.SysInfoSerialNum \, zzzzzzz} \]
where \text{zzzzzz} is the 7-character serial number of the compute node.

Step 3. Enter the following command:
\[ \text{asu set \, SYSTEM\_PROD\_DATA.SysEncloseAssetTag \, aaaaaaaaaaaaaaaaaaaaaaaaaaaaaa} \]
where \text{aaaaaaaaaaaaaaaaaaaaaaaaaaaaa} is the 33-character asset tag number of the compute node.

Step 4. Restart the IMM.
Step 5. Restart the server.

Locally: LAN over USB
If you omit any optional parameter, the default value is used. If one or more default values are used and the ASU cannot access the IMM2 by using the LAN over USB access method, the ASU automatically uses the KCS access method.

To update the UUID, in the ASU command-line interface, enter the following command:
asu set SYSTEM_PROD_DATA.SysInfoUUID *uuid* [--user *userid*][--password *password*]

where:

*uuid*

is the user-assigned hexadecimal value, up to 16 bytes, that identifies the compute node.

*userid*

is the IMM2 account name (1 of 12 accounts). The default is USERID.

*password*

is the IMM2 account password (1 of 12 accounts). The default is PASSW0RD (with a zero, not the letter O).

To update the DMI/SMBIOS data, complete the following steps:

**Step 1.** In the ASU command-line interface, enter the following command:

    asu set SYSTEM_PROD_DATA.SysInfoProdName *xxxxyyy* [--host *ipaddress*] [--user *userid*][--password *password*]

where:

*xxxx*

is the 4-digit machine type of the compute node.

*yyy*

is the 3-digit model number of the compute node.

*ipaddress*

is the internal LAN/USB IP address of the IMM2. The default is 169.254.95.118.

*userid*

is the IMM2 account name (1 of 12 accounts). The default is USERID.

*password*

is the IMM2 account password (1 of 12 accounts). The default is PASSW0RD (with a zero, not the letter O).

**Step 2.** Enter the following command:

    asu set SYSTEM_PROD_DATA.SysInfoSerialNum *zzzzzzz* [--host *ipaddress*] [--user *userid*][--password *password*]

where *zzzzzzz* is the 7-character serial number of the compute node.

**Step 3.** Enter the following command:

    asu set SYSTEM_PROD_DATA.SysEncloseAssetTag *aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa* [--host *ipaddress*] [--user *userid*][--password *password*]

where *aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa* is the 33-character asset tag number of the compute node.

**Step 4.** Restart the IMM.

**Step 5.** Restart the server.

**Remotely over a LAN**

If you omit any optional parameter, the default value is used.

To update the UUID, in the ASU command-line interface, enter the following command:

    asu set SYSTEM_PROD_DATA.SysInfoUUID *uuid* [--host *ipaddress*] [--user *userid*][--password *password*]

where:

*uuid*
is the user-assigned hexadecimal value, up to 16 bytes, that identifies the compute node.

```
ipaddress
```

is the external LAN IP address of the IMM2.

```
userid
```

is the IMM2 account name (1 of 12 accounts). The default is USERID.

```
password
```

is the IMM2 account password (1 of 12 accounts). The default is PASSW0RD (with a zero, not the letter O).

To update the DMI/SMBIOS data, complete the following steps:

Step 1. In the ASU command-line interface, enter the following command:

```
asu set SYSTEM_PROD_DATA.SysInfoProdName xxxxyyy --host ipaddress [--user userid] [--password password]
```

where:

```
xxxx
```

is the 4-digit machine type of the compute node.

```
yyy
```

is the 3-digit model number of the compute node.

```
ipaddress
```

is the external LAN IP address of the IMM2.

```
userid
```

is the IMM2 account name (1 of 12 accounts). The default is USERID.

```
password
```

is the IMM2 account password (1 or 12 accounts). The default is PASSW0RD (with a zero, not the letter O).

Step 2. Enter the following command:

```
asu set SYSTEM_PROD_DATA.SysInfoSerialNum zzzzzzz --host ipaddress [--user userid] [--password password]
```

where zzzzzzz is the 7-character serial number of the compute node.

Step 3. Enter the following command:

```
asu set SYSTEM_PROD_DATA.SysEncloseAssetTag aaaaaaaaaaaaaaaaaaa --host ipaddress [--user userid] [--password password]
```

where aaaaaaaaaaaaaaaaaaaa is the 33-character asset tag number of the compute node.

Step 4. Restart the IMM.

Step 5. Restart the server.

**Configuring a RAID array**

Use this information to configure a RAID array.

Configuring a RAID array applies only to a compute node in which two or more hard disk drives are installed.

**Note:** When you configure a RAID array, the hard disk drives must use the same type of interface. For example, a RAID array can be configured with two SAS hard disk drives or two SATA hard disk drives.
You can use two hard disk drives in the compute node to implement and manage RAID level-0 (striping) or RAID level-1 (mirror) arrays in operating systems that are listed on the ServerProven list at http://www.lenovo.com/serverproven. For the compute node, you must configure the RAID by using the LSI Configuration Utility program.

If an optional RAID expansion adapter is installed, you can use it to control all of the hard disk drives that are installed in the compute node. See the documentation that comes with the expansion adapter for information about how to configure the RAID array.

Important: You must create the RAID array before you install the operating system on the compute node.

You can use the LSI Logic Configuration Utility program to configure the hard disk drives and the SAS controller. To start the LSI Logic Configuration Utility, see “Using the LSI Logic Configuration Utility” on page 36.

**Using the LSI Logic Configuration Utility**

Use these instructions to start the LSI Logic Configuration Utility.

You can use the LSI Logic Configuration Utility to perform the following tasks:

- Set the device boot order
- Add or remove devices from the boot list
- Manage the RAID configuration

Note: The hard disk drive in the RAID configuration must use the same type of interface and must have identical capacity and speed.

To start the LSI Logic Configuration Utility program, complete the following steps:

Step 1. Connect a keyboard, monitor, and mouse to the console breakout cable and connect the console breakout cable to the compute node.

Step 2. Turn on the compute node (see “Turning on the compute node” on page 16).

Step 3. When the prompt Press <F1> Setup is displayed, press F1. If you have set an administrator password, you must type the administrator password to access the full Setup utility menu. If you do not type the administrator password, a limited Setup utility menu is available.

Step 4. From the Setup utility main menu, select System Settings; then select Storage.

Step 5. Use the arrow keys to select the controller from the list of adapters; then, press Enter.

Step 6. Follow the instructions on the screen to change the settings of the selected items; then, press Enter. If you select SAS Topology or Advanced Adapter Properties, additional screens are displayed.

**Setting up the LAN-on-motherboard (LOM) feature**

This topic provides information about setting up the LAN-on-motherboard (LOM) feature.

Some models of the x440 Compute Node Types 7167 and 2590 have an Ethernet LAN-on-motherboard (LOM) controller integrated on the system board. The LOM provides the following features:

- Two operational mode choices:
  - One-port physical NIC mode (pNIC), multichannel disabled, which is the default.
  - Virtual NIC mode (vNIC), multichannel enabled. vNIC mode enables up to 4 virtual NIC interfaces per 10 Gb physical port (8 total for the LOM).
For more information about how LOM ports are mapped to switch modules in the chassis, see.

- Two options for vNIC linking:
  - VNIC1, Virtual Fabric mode.
  - VNIC2, Switch Independent mode.

  You can select these options using the Setup utility (F1).

- Link auto negotiation 10 Gb/1 Gb full duplex.
- Bus-mastering support.
- Direct memory access (DMA) support.
- Interoperability with existing FC SAN infrastructures, such as switches, arrays, SRM tools (including Emulex utilities), SAN practices, and other infrastructures.
- Unified Ethernet-to-FC SAN connectivity provided by an FCoE switch.
- 10 Gb MAC features such as MSI-X support, jumbo frames (8 KB) support, VLAN tagging (802.1Q, PER priority pause/priority flow control), and advanced packet filtering.
- NIC failover support.
- Support for IBM Fabric Manager (IFM).
- Preboot Execution Environment, UEFI, and Legacy PXE.
- Wake on LAN (WOL).
- SRIOV support.
- ISCSI or FCoE capabilities, which can be enabled through Features on Demand. When enabled, the ISCSI or FCoE operations are supported on the second vNIC of the physical port.

Separate NIC, ISCSI, and FCoE drivers are provided to support all configurations. To obtain the device drivers, go to http://www.emulex.com/downloads/oemqualified/ibm/vfarc-software-kits/.

No host operating system changes are required for you to use the LOM features. NIC and HBA functionality (including device management, utilities, and other functions) are transparent to the host operating system.

For more information about using the LOM feature, go to http://www.emulex.com/support/.
Chapter 3. Installing the operating system

Use these instructions to install the operating system on the compute node.

To determine which operating systems are supported, go to http://www.lenovo.com/serverproven/.

Provisioning is the set of actions that you take to install the operating system. To install the operating system on a compute node, you can use any of the following methods:

- **Lenovo ServerGuide Setup and Installation CD**
  Use the ServerGuide Setup and Installation CD to install a supported Microsoft Windows operating system only. To provision a compute node with an operating system by using the ServerGuide Setup and Installation CD, complete the following steps:
  1. Download the ServerGuide Setup and Installation CD ISO image to a computer that is connected over the management network to the Flex System Manager management software (if installed) that is managing the compute node.
  2. Connect to the Flex System Manager management software that is managing the Flex System chassis in which the compute node is installed.
  3. From Flex System Manager Chassis Manager, select the compute node. In the Actions column, select **Remote Control**.

     **Note:** The user ID that you use to log in to Flex System Manager management software must have sufficient user permissions to manage the compute node.

  4. From the Remote Control session, mount the ServerGuide Setup and Installation CD bootable media (using Remote Media). When the ServerGuide program prompts you to mount the operating-system image, unmount the ServerGuide Setup and Installation CD and mount the operating-system image. You can also install an ISO image of the operating system from an external or portable storage device, such as a USB device, by using Remote Media. For more information, see .
  5. Start the compute node to boot the media and install the operating system.

- **Lenovo ToolsCenter Bootable Media Creator**
  Use Lenovo ToolsCenter Bootable Media Creator to create an Lenovo ServerGuide Setup and Installation CD for deploying Windows operating systems and updates from UpdateXpress System Packs. For more information about the Lenovo Bootable Media Creator, see .
  To provision a compute node with an operating system by using Lenovo ToolsCenter Bootable Media Creator, complete the following steps:
  1. Download Lenovo ToolsCenter Bootable Media Creator to a computer that is connected over the management network to the Flex System Manager management software that is managing the compute node.
  2. Connect to the Flex System Manager management software (if installed) that is managing the Flex System chassis in which the compute node is installed.
  3. From Flex System Manager Chassis Manager, select the compute node. In the Actions column, select **Remote Control**.

     **Note:** The user ID that you use to log in to Flex System Manager management software must have sufficient user permissions to manage the compute node.

  4. From the Remote Control session, mount the ServerGuide Setup and Installation CD bootable media (using Remote Media). When the ServerGuide program prompts you to mount the operating-system image, unmount the ServerGuide Setup and Installation CD and mount the operating-system image.
You can also install an ISO image of the operating system from an external or portable storage device, such as a USB device, by using Remote Media. For more information, see.

5. Start the compute node to boot the media and install the operating system.

- **Lenovo XClarity Administrator**
  You can use the Lenovo XClarity Administrator (if available) to deploy operating systems and virtual images to multiple compute nodes that do not already have an operating system installed. This function allows you to deploy Red Hat Enterprise Linux (RHEL) including Kernel-based Virtual Machine (KVM), VMware vSphere Hypervisor (ESXi) with Lenovo Customization, and Microsoft Windows 2012. For more information, see https://support.lenovo.com/us/en/documents/LNVO-XCLARITY.

- **Flex System Manager management software**
  You can also use Flex System Manager management software (if available) to deploy operating system and virtual images to multiple compute nodes that do not already have an operating system installed. This function is limited to deploying VMware ESXi and RHEL KVM hypervisors. For more information, see.

- **Lenovo ServerGuide Scripting Toolkit**
  The ServerGuide Scripting Toolkit is a collection of system-configuration tools and installation scripts that you can use to deploy software to your compute node in a repeatable, predictable manner (see “Using Lenovo ServerGuide Scripting Toolkit” on page 41).

- **Operating-system installation instructions**
  Download the latest operating-system installation instructions and install the operating system.

**Important:** The operating system in the compute node must provide USB support for the compute node to recognize and use the keyboard, mouse, and removable-media drives.

---

**Using the ServerGuide Setup and Installation CD**

The *ServerGuide Setup and Installation* CD provides software setup tools and installation tools that are designed for your compute node. The ServerGuide program detects the compute node model and optional hardware devices that are installed and uses that information during setup to configure the hardware. The ServerGuide program simplifies operating-system installations by providing updated device drivers and, in some cases, installing them automatically.

You can download a free image of the *ServerGuide Setup and Installation* CD from http://www.ibm.com/support/entry/portal/docdisplay?Indocid=SERV-GUIDE.

In addition to the *ServerGuide Setup and Installation* CD, you must have your operating-system CD to install the operating system.

**ServerGuide features**

This information provides an overview of the ServerGuide features.

Features and functions can vary slightly with different versions of the ServerGuide program. To learn more about the version that you have, start the *ServerGuide Setup and Installation* CD and view the online overview. Not all features are supported on all compute node models.

The ServerGuide program has the following features:

- An easy-to-use interface
- Diskette-free setup, and configuration programs that are based on detected hardware
- Device drivers that are provided for the compute node model and detected hardware
- Operating-system partition size and file-system type that are selectable during setup
The ServerGuide program performs the following tasks:

- Sets system date and time
- Detects installed optional hardware devices and provides updated device drivers for most adapters and devices
- Provides diskette-free installation for supported Windows operating systems
- Includes an online readme file with links to tips for hardware and operating-system installation

**Typical operating-system installation**

The ServerGuide program can reduce the time it takes to install an operating system. It provides the device drivers that are required for your hardware and for the operating system that you are installing. This section describes a typical ServerGuide operating-system installation.

**Note:** Features and functions can vary slightly with different versions of the ServerGuide program.

1. After you have completed the setup process, the operating-system installation program starts. (You will need your operating-system CD to complete the installation.)
2. The ServerGuide program stores information about the compute node model, IMM2, hard disk drive controllers, and network adapters. Then, the program checks the CD for newer device drivers. This information is stored and then passed to the operating-system installation program.
3. The ServerGuide program presents operating-system partition options that are based on your operating-system selection and the installed hard disk drives.
4. The ServerGuide program prompts you to insert your operating-system CD and restart the compute node. At this point, the installation program for the operating system takes control to complete the installation.

**Installing the operating system without using ServerGuide**

Use this information to install the operating system on the compute node without using ServerGuide.

If you have already configured the compute node hardware and you are not using the ServerGuide program to install your operating system, you can download operating-system installation instructions for the compute node from [http://www.lenovo.com/support](http://www.lenovo.com/support).

**Using Lenovo ServerGuide Scripting Toolkit**

The ServerGuide Scripting Toolkit is a collection of system-configuration tools and installation scripts that you can use to deploy software to your Flex System compute node in a repeatable, predictable manner. When the ServerGuide Scripting Toolkit is used with ServerGuide, it provides a total solution for deploying Flex System compute nodes in an unattended mode.

For more information about using the ServerGuide Scripting Toolkit, see .
Chapter 4. Accessing the IMM2

Use this information to access the integrated management module II (IMM2) remotely by using the command-line interface (IPMI shell) or serial over LAN, or locally through the LAN over USB interface.

The IMM2 is a second generation of the functions that were formerly provided by the baseboard management controller hardware. It combines service processor functions, video controller, and remote presence function in a single chip.

For more information about the IMM2, see http://publib.boulder.ibm.com/infocenter/systemx/documentation/topic/com.lenovo.sysx.imm2.doc/printable_doc.html

Accessing the IMM2 remotely

The integrated management module II (IMM2) provides remote systems-management capabilities.

- Command-line interface
  The command-line interface provides direct access to systems-management functions through the IPMI 2.0 protocol. Use the command-line interface to issue commands to control the compute node power, view system information, and identify the compute node. You can also save one or more commands as a text file and run the file as a script.

- Serial over LAN
  Establish a Serial over LAN (SOL) connection to manage compute nodes from a remote location. You can remotely view and change the UEFI settings, restart the compute node, identify the compute node, and perform other management functions. Any standard Telnet client application can access the SOL connection.

  See your operating-system documentation for information about SOL commands that you can enter by using the command-line interface.

- Web interface
  Use the secure IMM2 web interface to perform systems-management activities within a web browser. For information about accessing the web interface, see “Logging in to the web interface” on page 44.

Viewing the network access tag

Use this information to locate the IP address by viewing the network access tag, or by using the Setup utility or systems-management software.

To access the web interface, you need the IP address of the IMM2. You can locate the IP address by viewing the network access tag. The network access tag is attached to the front of the compute node. The front of the network access tag lists the first four IMM MAC addresses in the lower-right corner, as shown in the following illustration.
The rear of the network access tag lists the IPv6 link local address (LLA), as shown in the following illustration.

The MAC address is also available through the Setup utility, the CMM `cinstatus` command, and the CMM web interface.

- For more information about the Setup utility, see “Using the Setup utility” on page 26.
- For more information about the CMM `cinstatus` command, see the .
- From the CMM web interface, select **Compute Nodes** from the Chassis Management menu. For more information, see the . All fields and options are described in the CMM web interface online help.

**Note:** If the network access tag is missing from the front of the compute node, you can also locate the MAC address on a label located on the bottom of the compute node.

### Logging in to the web interface

Use these instructions to log in to the IMM2 web interface.

**Notes:**

- If you are logging on to the IMM2 for the first time after installation, the IMM2 defaults to Dynamic Host Configuration Protocol (DHCP). If a DHCP host is not available, the IMM2 assigns a static IP address between 192.168.70.101 and 192.168.70.114, depending on the bay in which the compute node is installed.
- You can also assign IP addresses through the CMM `ifconfig` command. For more information about the CMM `ifconfig` command, see the .
- To assign IP addresses from the CMM web interface, click **Mgt Module Management ➔ Network ➔ Ethernet**.
- If the CMM and compute nodes are set to use DHCP, and the CMM loses connectivity to the network, the CMM attempts to acquire a new IP address when network connectivity is restored. The compute nodes will not attempt to acquire an IP address again and the compute node continues to use their existing IP addresses. Therefore, if you experience network problems on compute nodes after connectivity between the CMM and the network has been restored, you might need to reset the system-management processor on each of the compute nodes in the chassis (including Flex System Manager management software, if it is installed).
• The IMM2 user name and password are provisioned through the CMM. To use tools such as Advanced Settings Utility (ASU) for out-of-band communications, you must define local user accounts from the IMM web interface. To define local user accounts from the IMM web interface, click **IMM Management ➔ Users**. The local user accounts are valid only for accessing the IMM web interface on this compute node. However, if you back up the IMM configuration, that backup will not contain the local user accounts that were created from the IMM user interface.

• The IMM2 logs you out of the web interface if your browser is inactive for the number of minutes that you have specified for the timeout period. To modify the timeout period, from the IMM web interface, click **IMM Management > User > Global Login Settings > General**.

1. Open a web browser and in the **Address** or **URL** field, type the IP address or host name of the IMM2 to which you want to connect.

2. On the Login page, type the CMM user name and CMM password. You are then directed to the main page of the IMM2 web interface. If you are using the IMM2 for the first time, you can obtain the user name and password from your system administrator. All login attempts are documented in the IMM event log.

**IMM2 action descriptions**

Navigate to activities you perform with the IMM at the top of the IMM window. The title bar identifies the user name that is logged in, allows you to configure **Settings** for the status screen refresh rate and a custom trespass message, and **Log out** of the IMM web interface. Beneath the title bar are tabs that allow you to access various IMM2 functions, as listed in Table 2 “IMM2 actions” on page 45.

### Table 2. IMM2 actions

<table>
<thead>
<tr>
<th>Tab</th>
<th>Selection</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Status</td>
<td></td>
<td>The System Status page allows you to view system status, active system events, and hardware health information. It provides quick links to the Server Power Actions, and Remote Control functions of the Server Management tab, and allows you to view an image of the last operating-system-failure screen capture.</td>
</tr>
<tr>
<td>Events</td>
<td>Event Log</td>
<td>The Event Log page displays entries that are currently stored in the IMM event log. The log includes a text description of system events that are reported, including information about all remote access attempts and configuration changes. All events in the log are time stamped, using the IMM2 date and time settings. Some events also generate alerts, if they are configured to do so. You can sort and filter events in the event log and export them to a text file.</td>
</tr>
<tr>
<td>Event Recipients</td>
<td></td>
<td>The Event Recipients page allows you to manage who will be notified of system events. It allows you to configure each recipient, and manage settings that apply to all event recipients. You can also generate a test event to verify notification feature operation.</td>
</tr>
<tr>
<td>Service and Support</td>
<td>Download Service Data</td>
<td>The Download Service Data page creates a compressed file of information that can be used by Support to assist you.</td>
</tr>
<tr>
<td>Server Management</td>
<td>Server Firmware</td>
<td>The Server Firmware page displays firmware levels and allows you to update the IMM2 firmware, compute node firmware, and DSA firmware.</td>
</tr>
<tr>
<td>Tab</td>
<td>Selection</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Remote Control</td>
<td></td>
<td>The Remote Control page allows you to control the compute node at the operating system level. It provides access to both Remote Disk and Remote Console functionality. You can view and operate the compute node console from your computer, and you can mount one of your computer disk drives, such as the CD-ROM drive or the diskette drive, on the compute node. When you have mounted a disk, you can use it to restart the compute node and to update firmware on the compute node. The mounted disk appears as a USB disk drive that is attached to the compute node.</td>
</tr>
<tr>
<td>Server Properties</td>
<td></td>
<td>The Server Properties page provides access to various properties, status, and settings for your compute node:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The General Settings tab displays information that identifies the system to operations and support personnel.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The LEDs tab displays the status of all system LEDs. It also allows you to change the state of the location LED.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The Hardware Information tab displays compute node vital product data (VPD). The IMM2 collects compute node information, compute node component information, and network hardware information.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The Environmentals tab displays voltage and temperature information for the compute node and its components.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The Hardware Activity tab displays a history of Field Replacable Unit (FRU) components that have been added to or removed from the system.</td>
</tr>
<tr>
<td>Server Power Actions</td>
<td></td>
<td>The Server Power Actions page provides full remote power control over your compute node with power-on, power-off, and restart actions.</td>
</tr>
<tr>
<td>Disks</td>
<td></td>
<td>The Disks page displays the status of hard disk drives in the system. You can click on a drive name to display active events for the hard disk drive.</td>
</tr>
<tr>
<td>Processors</td>
<td></td>
<td>The Processors page displays the microprocessors in the system, along with their status and rated speed. You can click on a microprocessor name to display events and additional hardware information for the microprocessor.</td>
</tr>
<tr>
<td>Server Timeouts</td>
<td></td>
<td>The Server Timeouts page allows you to manage compute node start timeouts to detect and recover from compute node hang occurrences.</td>
</tr>
<tr>
<td>PXE Network Boot</td>
<td></td>
<td>The PXE Network Boot page allows you to change the host compute node startup (boot) sequence for the next restart to attempt a Preboot Execution Environment (PXE)/Dynamic Host Configuration Protocol (DHCP) network startup. The host startup sequence will be altered only if the host is not under Privileged Access Protection (PAP).</td>
</tr>
<tr>
<td>Latest OS Failure Screen</td>
<td></td>
<td>The Latest OS Failure Screen page displays a screen image, when available, of the most recent operating system failure on the compute node. For your IMM to capture operating system failure screens, the operating system watchdog must be enabled.</td>
</tr>
<tr>
<td>Tab</td>
<td>Selection</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IMM Management</td>
<td>IMM Properties</td>
<td>The IMM Properties page provides access to various properties, status, and settings for your IMM2:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The Firmware tab provides a link to the Server Firmware section of Server Management.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The IMM Date and Time Settings tab allows you to view and configure date and time settings for the IMM2.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The Serial Port tab configures the IMM2 serial port settings. These settings include the serial port baud rate used by the serial port redirection function and the key sequence to switch between the serial redirection and command-line interface (CLI) modes.</td>
</tr>
<tr>
<td>Users</td>
<td></td>
<td>The Users page allows you to configure the IMM2 login profiles and global login settings, and to view users that are currently logged in to the IMM2. Global login settings include enabling Lightweight Directory Access Protocol (LDAP) compute node authentication, setting the web inactivity timeout, and customizing the account security settings. <strong>Note:</strong> Some things cannot be done (e.g. cannot create users) if the CMM is managing IPMI/SNMPv3 user account.</td>
</tr>
<tr>
<td>Network</td>
<td></td>
<td>The Network Protocol Properties page provides access to networking properties, status, and settings for your IMM2:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The Ethernet tab manages how the IMM2 communicates using Ethernet.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The SNMP tab configures the SNMPv1 and SNMPv3 agents.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The DNS tab displays the DNS servers that the IMM2 interacts with.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The DDNS tab enables or disables and configures Dynamic DNS for the IMM2.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The SMTP tab configures SMTP compute node information used for alerts sent via email.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The LDAP tab configures user authentication for use with one or more LDAP compute nodes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The Telnet tab manages Telnet access to the IMM2.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The USB tab controls the USB interface used for in-band communication between the compute node and the IMM2. These settings do not affect the USB remote control functions (keyboard, mouse, and mass storage).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The Port Assignments tab allows you to change the port numbers used by some services on the IMM2.</td>
</tr>
<tr>
<td>IMM Management</td>
<td>Security</td>
<td>The IMM Security page provides access to security properties, status, and settings for your IMM2:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The HTTPS Server tab allows you to enable or disable the HTTPS compute node and manage its certificates.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The CIM Over HTTPS tab allows you to enable or disable CIM over HTTPS and manage its certificates.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The LDAP Client tab allows you to enable or disable LDAP security and manage its certificates.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The SSH Server tab allows you to enable or disable the SSH compute node and manage its certificates.</td>
</tr>
</tbody>
</table>
Table 2. IMM2 actions (continued)

<table>
<thead>

<td><strong>Attention:</strong> When you click Reset IMM to factory defaults..., all of the modifications that you made to the IMM2 are lost.</td>
</tr>
<tr>
<td>Activation Key</td>
<td></td>
<td>The Activation Key Management page allows you to manage activation keys for optional IMM2 or compute node Features on Demand (FoD) features.</td>
</tr>
<tr>
<td>Management</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Accessing the IMM2 using the LAN over USB interface

Unlike a baseboard management controller, the IMM2 does not require IPMI device drivers or USB daemons for in-band IMM2 communication. Instead, a LAN over USB interface enables in-band communication to the IMM2; the IMM2 hardware on the system board presents an internal Ethernet interface from the IMM2 to the operating system. LAN over USB is also called the *USB in-band interface* in the IMM2 web interface.

The following table shows the IP addresses for the IMM2 and the host.

**Table 3. LAN over USB addresses**

<table>
<thead>
<tr>
<th>IMM2 IP address</th>
<th>IMM2 IP subnet mask</th>
<th>Host address</th>
<th>Host subnet</th>
<th>Host subnet mask</th>
<th>Keyboard Controller Style (KCS) address</th>
</tr>
</thead>
<tbody>
<tr>
<td>169.254.95.118</td>
<td>255.255.255.0</td>
<td>169.254.95.120</td>
<td>169.254.95.0/24</td>
<td>255.255.255.0</td>
<td>0x8C80</td>
</tr>
</tbody>
</table>

Potential conflicts with the LAN over USB interface

In some situations, the LAN over USB interface can conflict with certain network configurations, applications, or both. For example, Open MPI attempts to use all the available network interfaces on a server or compute node. Open MPI detects the IMM2 LAN over USB interface and attempts to use it to communicate with other systems in a clustered environment. The LAN over USB interface is an internal interface, so this interface does not work for external communication with other systems in the cluster.

Resolving conflicts with the IMM2 LAN over USB interface

Use any of the following actions to resolve LAN over USB conflicts with network configurations and applications.

Use one of the following methods to resolve LAN over USB conflicts.

**Note:** For conflicts with Open MPI, configure the application so that it does not attempt to use this interface.
• Take down the interface (run `ifdown` under Linux).
• Remove the device driver (run `rmmod` under Linux).
• Disable the LAN over USB interface from the CMM web interface.

**Note:** You cannot update the firmware for a compute node while the LAN over USB interface is disabled. Before updating the firmware, you must re-enable the interface. After updating the firmware, you can disable the interface again.

To disable the LAN over USB interface from the CMM web interface, complete the following steps.

1. Log in to the CMM web interface.
2. From the CMM web interface homepage click **Chassis Management ➔ Compute Nodes**.
3. Click the compute node ID.
4. Click the **General** tab.
5. Uncheck **Enable Ethernet Over USB** to disable the LAN over USB interface.

### Configuring the LAN over USB interface

An IMM2 must be configured to use the LAN over USB interface. The firmware update package or Advanced Settings Utility attempts to perform the setup automatically, if needed. If the automatic setup fails or if you prefer to set up the LAN over USB manually, use one of the following processes.

### Installing the LAN over USB Windows device driver

When you install a Windows operating system, there will be an unknown RNDIS device in the Device Manager. Lenovo provides a Windows INF file that identifies this device. The signed version of the INF file is included in all of the Windows versions of the IMM2, UEFI, and DSA update packages. Complete the following steps to install `ibm_rndis_server_os.inf`.

To install the LAN over USB device driver for Windows, complete the following steps.

**Note:** You only have to perform these steps if the compute node is running a Windows operating system and the `ibm_rndis_server_os.inf` file has not been previously installed. The file only has to be installed once. It is required by Windows operating systems to detect and use the LAN over USB functionality.

Step 1. Obtain a Windows version of the server or compute node UEFI code package (see “Updating firmware and device drivers” on page 23 for more information).

Step 2. Extract the `ibm_rndis_server_os.inf` and `device.cat` files from the firmware update package and copy them to the `\WINDOWS\inf` subdirectory.

**Note:** You can use the `-x path` command-line interface option to extract the files. For more information about this option, see the readme file that comes with the update package.

Step 3. **(Windows 2003)** Install the `ibm_rndis_server_os.inf` file by right-clicking the file and clicking **Install**. This generates a PNF file of the same name in `\WINDOWS\inf`.

**Note:** You can use the `-x path` command-line interface option to extract the files. For more information about this option, see the readme file that comes with the update package.

Step 4. **(Windows 2008)** Click **Computer Management ➔ Device Manager** and find the RNDIS Device. Click **Properties ➔ Driver ➔ Reinstall driver**. Point the server or compute node to the `\Windows \inf` directory where it can find the `ibm_rndis_server_os.inf` file and install the device.

Step 4. **(Windows 2008)** Click **Computer Management ➔ Device Manager**. Right-click **Network adapters** and select **Scan for hardware changes**. A small pop-up confirms that the Ethernet device is found and installed. The New Hardware Wizard starts automatically.
Step 5. When you are prompted Can Windows connect to Windows Update to search for software?, select No, not this time. Click Next to continue.

Step 6. When you are prompted What do you want the wizard to do?, select Install from a list or specific location (Advanced). Click Next to continue.

Step 7. When you are prompted Please choose your search and installation options, select Don't search. I will choose the driver to install. Click Next to continue.

Step 8. When you are prompted Select a hardware type, and then click Next, select Network adapters. Click Next to continue.

Step 9. When you are prompted with the statement Completing the Found New Hardware Wizard, click Finish. A new local area connection appears. If the message This connection has limited or no connectivity is displayed, ignore this message.

Step 10. Return to the Device Manager. IBM USB Remote NDIS Network Device or Lenovo USB Remote NDIS Network Device appears under Network Adapters.

Step 11. Use the Setup utility to view or set the IP address. See Table 3 “LAN over USB addresses” on page 48 for information about the IP addresses.

a. Connect a keyboard, monitor, and mouse to the console breakout cable and connect the console breakout cable to the compute node.

b. Turn on the compute node (see “Turning on the compute node” on page 16).

c. When the prompt Press <F1> Setup is displayed, press F1. If you have set an administrator password, you must type the administrator password to access the full Setup utility menu. If you do not type the administrator password, a limited Setup utility menu is available.

e. Locate the IP address.

f. Exit from the Setup utility.

Installing the LAN over USB Linux device driver

Versions of Linux since RHEL5 Update 3 and SLES10 Service Pack 2 support the LAN over USB interface by default. This interface is detected and displayed during the installation of these operating systems.

See Table 3 “LAN over USB addresses” on page 48 for information about the IP addresses.

Note: Older Linux distributions might not detect the LAN over USB interface and might require manual configuration. For information about configuring LAN over USB on specific Linux distributions, see http://www.ibm.com/support/entry/portal/docdisplay?lndocid=MIGR-5083207.

The IMM2 LAN over USB interface requires that the usbnet and cdc_ether device drivers be loaded. If the drivers have not been installed, use modprobe to install them. When these drivers are installed, the IMM2 USB network interface is shown as a network device in the operating system. To discover the name that the operating system has assigned to the IMM2 USB network interface, type dmesg | grep -i cdc ether
Chapter 5. Parts listing, Types 7167 and 2590

The following replaceable components are available for the Lenovo Flex System x440 Compute Node Types 7167 and 2590.

For an updated parts listing on the web, go to http://www.lenovo.com/support.

**Note:** The illustrations in this document might differ slightly from your hardware.

Replaceable components consist of consumable parts, structural parts, and customer replaceable units (CRUs):

- **Consumable parts:** Purchase and replacement of consumable parts (components, such as batteries and printer cartridges, that have depletable life) is your responsibility. If Lenovo acquires or installs a consumable part at your request, you will be charged for the installation.

- **Structural parts:** Purchase and replacement of structural parts (components such as the top cover and bezel) is your responsibility. If Lenovo acquires or installs a structural part at your request, you will be charged for the installation.

- **Tier 1 customer replaceable unit (CRU):** Replacement of Tier 1 CRUs is your responsibility. If Lenovo installs a Tier 1 CRU at your request without a service contract, you will be charged for the installation.

- **Tier 2 customer replaceable unit:** You may install a Tier 2 CRU yourself or request Lenovo to install it, at no additional charge, under the type of warranty service that is designated for your compute node. Tier 2 CRUs should be installed only by trained service technicians.

For information about the terms of the warranty and getting service and assistance, see the *Warranty Information* document.

</tbody>
</table>

To order a consumable part, complete the following steps:

2. From the **Products** menu, select **Upgrades, accessories & parts**.
3. Click **Obtain maintenance parts**; then, follow the instructions to order the part from the retail store.

If you need help with your order, call the toll-free number that is listed on the retail parts page, or contact your local representative for assistance.
Chapter 6. Troubleshooting

Use this information to diagnose and correct problems that might occur in your x440 Compute Node Types 7167 and 2590.

The information in this section describes tools and procedures for solving hardware and software problems. If you cannot diagnose and correct a problem by using the information, see Appendix A “Getting help and technical assistance” on page 893 for more information.

Service bulletins

IBM continually updates the support website with tips and techniques that you can use to solve problems that you might have with the x440 Compute Node Types 7167 and 2590.

To find service bulletins that are available for the x440 Compute Node Types 7167 and 2590, go to http://www.lenovo.com/support and search for the terms 7167 or 2590 and retain.

Diagnostic tools

Use this information to review the diagnostic tools to diagnose and solve hardware-related problems.

Light path diagnostics

Use this information as an overview of light path diagnostics.

Light path diagnostics is a system of LEDs above the control panel and on various internal components of the compute node. When an error occurs, LEDs can be lit throughout the compute node to help identify the source of the error.

Viewing the light path diagnostics LEDs

Use this information to locate and identify the light path diagnostics LEDs.

Before you work inside the compute node to view light path diagnostics LEDs, read “Safety” on page iii and “Installation guidelines” on page 827.

If an error occurs, view the light path diagnostics LEDs in the following order:

1. Look at the control panel on the front of the compute node.

- If the check log LED is lit, it indicates that an Automatic BIOS Recovery has occurred. The compute node will start by using the backup UEFI image.
- If the fault LED is lit, it indicates that an error has occurred; view the light path diagnostics panel and LEDs to isolate the failing component.
2. To view the light path diagnostics LEDs, select one of the following procedures:

- You can view the LEDs through the CMM `led` command, the CMM web interface, the Lenovo XClarity Administrator (if available), or the Flex System Manager management software (if available).
  - For more information about the CMM `led` command, see the .
  - From the CMM web interface, select **Blade Servers** from the **Chassis Management** menu. All fields and options are described in the CMM web interface online help.
  - For more information about the Flex System Manager management software, see .

- If you are in the same location as the compute node, you can complete the following steps:
  a. Remove the compute node from the Flex System chassis, (see “Removing a compute node from a chassis” on page 828 for instructions).
  b. Carefully lay the compute node on a flat, static-protective surface.
  c. Open the compute node cover (see “Removing the compute node cover” on page 836 for instructions).
  d. Remove the air baffles that are installed over the DIMM connectors.
  e. Press the power button. When you press the power button, LEDs on the light path diagnostics panel and the system board will be lit if there are any hardware-related issues.

  **Note:** The power source for light path diagnostics is designed to last only a short time. If you press the power button and the light path diagnostics LED lights, light path diagnostics is charged to light the LEDs.

The following illustration shows the LEDs on the light path diagnostics panel.

![Light path diagnostics panel diagram](image1)

The following illustration shows the locations of the light path diagnostics LEDs on the system board.

![Light path diagnostics locations on system board](image2)
Light path diagnostics LEDs

Use this information to diagnose possible errors that are indicated by the light path diagnostics LEDs.

The following table describes the LEDs on the light path diagnostics panel and the light path diagnostics LEDs on the system board. LEDs on the light path card are visible from the top of the compute node. See “Viewing the light path diagnostics LEDs” on page 57 for information about lighting the LEDs.

<table>
<thead>
<tr>
<th>Lit light path diagnostics LED</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Light path diagnostics</td>
<td>This LED lights when the light path LED card is installed</td>
</tr>
<tr>

<td>-------------</td>
</tr>
<tr>
<td>None</td>
<td>An error has occurred and cannot be isolated, or the IMM2 has failed.</td>
</tr>
</tbody>
</table>
| Battery error | The battery failed. | 1. Reseat the battery.  
2. Replace the battery.  
3. (Trained service technician only) Replace the base assembly. |
| DIMM x error | A memory error occurred. | 1. Make sure that the DIMM that is indicated by the lit LED is supported.  
2. Reseat the DIMM that is indicated by the lit LED.  
3. Replace the DIMM that is indicated by the lit LED (see “Removing a DIMM” on page 839, and “Installing a DIMM” on page 840)  
**Note:** Multiple DIMM LEDs do not necessarily indicate multiple DIMM failures. If more than one DIMM LED is lit, reseat or replace one DIMM at a time until the error is corrected (see “Removing a DIMM” on page 839, and “Installing a DIMM” on page 840) |
| Light path diagnostics LED | System board light path diagnostics LEDs have power. | Check for error LEDs that are lit on the system board. |
| Microprocessor x error | The microprocessor has failed, or overheated, or the boot microprocessor is missing. | 1. Check the CMM log for more information. Perform the appropriate action.  
2. If the log shows that a microprocessor is disabled or that a microprocessor IERR has occurred, perform the appropriate action.  
3. (Trained service technician only) Reset the microprocessor that is indicated by the lit LED.  
4. (Trained service technician only) Replace the microprocessor that is indicated by the lit LED. |
| Microprocessor mismatch | The microprocessors do not match. | Make sure that all installed microprocessors are identical (number of cores, cache size, type, clock speed, and internal / external clock frequencies). |
Table 6. Light path LED errors (continued)

<table>
<thead>
<tr>
<th>Light path diagnostics LED</th>
<th>Description</th>
<th>Action</th>
</tr>
</thead>
</table>
| NMI                        | The system board failed. | 1. Reinsert the compute node, and then restart the compute node. Check the IMM event log for information about the error.  
2. (Trained service technician only) Replace the base assembly. |
| System board               | The system board failed. | (Trained service technician only) Replace the base assembly. |
| Temperature                | The system temperature has exceeded the threshold level | 1. Check the function of the shared compute node and chassis unit resources.  
2. Make sure that the room temperature is not too high. |
| Hard disk drive            | A hard disk drive failed. | Run the fixed disk or attached disk diagnostic test. If the drive passes the test but continues to have a problem replace the hard disk drive (see “Removing a hot-swap hard disk drive” on page 856 and “Installing a hot-swap hard disk drive” on page 856). |
| Adapter fault              | An adapter failed. | Run the adapter card diagnostics test. If adapter passes the test but continues to have a problem, replace the adapter. |

**IMM event log**

Use this information as an overview of the IMM event log.

The integrated management module II (IMM2) consolidates the system-management processor functionality, video controller, and remote presence capabilities in a single chip on the system board. The IMM2 monitors all components of the compute node and posts events in the IMM event log. In addition, most events are also sent to the Chassis Management Module event log. You can view the IMM event log through the Dynamic System Analysis (DSA) program (as the ASM event log).

To diagnose and resolve IMM error codes, see “IMM messages” on page 202.

**Viewing event logs through the Setup utility**

You can view the IMM and POST events through the Setup utility.

To view the POST event log or system-event log, complete the following steps:

Step 1. Connect a keyboard, monitor, and mouse to the console breakout cable and connect the console breakout cable to the compute node.

Step 2. Turn on the compute node.

Step 3. When the prompt <F1> Setup is displayed, press F1. If you have set both a power-on password and an administrator password, you must type the administrator password to view the event logs.

Step 4. Select System Event Logs and use one of the following procedures:
- To view the POST event log, select POST Event Viewer.
- To view the system-event log, select System Event Log.

**Viewing event logs without restarting the compute node**

Methods are available for you to view one or more event logs without having to restart the compute node.

You can view the Chassis Management Module event log using the Lenovo XClarity Administrator, in the Flex System Manager Chassis Manager, or through the Event Log link in Flex System Manager management software. For more information about the Lenovo XClarity Administrator, see https://support.lenovo.com/us/en/documents/LNVO-XCLARITY. For more information about Flex System Manager management software, see .

You can also view the Chassis Management Module event log through the Event Log link by using the CMM displaylog command or the CMM web interface.

**Note:** If event IDs are not currently displayed in the Event Log page, you can enable them. To do so, click Filter Events and select the Event ID check box under Visible columns.
• For more information about the CMM `displaylog` command, see the.
• From the CMM web interface, select Event Log from the Events menu. For more information, see the. All fields and options are described in the CMM web interface online help.

If you have installed DSA Portable Edition, you can use it to view the system-event log (as the IPMI event log), the operating-system event logs, or the merged DSA log. You can also use DSA Preboot to view these logs, although you must restart the compute node to use DSA Preboot. To install Portable DSA or DSA Preboot or to download a DSA Preboot CD image, go to https://support.lenovo.com/us/en/documents/LNVO-DSA.

If IPMItool is installed in the compute node, you can use it to view the system-event log. Most recent versions of the Linux operating system come with a current version of IPMItool. For information about IPMItool, complete the following steps.

**Note:** Changes are made periodically to the Lenovo website. The actual procedure might vary slightly from what is described in this document.

2. Click Linux.
3. Click the Linux blueprints tab.
4. Click Blueprints for Linux on IBM systems or Blueprints for Linux on Lenovo systems, and then click Using Intelligent Platform Management Interface (IPMI) on IBM Linux platforms or Using Intelligent Platform Management Interface (IPMI) on Lenovo Linux platforms.

The following table describes the methods that you can use to view the event logs, depending on the condition of the compute node. The first two conditions generally do not require that you restart the compute node.

### Table 8. Methods for viewing event logs

<table>
<thead>
<tr>
<th>Condition</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>The compute node is not hung and is connected to a network.</td>
<td>Use any of the following methods:</td>
</tr>
<tr>
<td></td>
<td>• In a web browser, type the IP address of the Chassis Management Module and go to the Event Log page.</td>
</tr>
<tr>
<td></td>
<td>• Run Portable or Installable DSA to view the event logs or create an output file that you can send to Support.</td>
</tr>
<tr>
<td></td>
<td>• Use IPMItool to view the system-event log.</td>
</tr>
<tr>
<td>The compute node is not hung and is not connected to a network.</td>
<td>Use IPMItool locally to view the system-event log.</td>
</tr>
<tr>
<td>The compute node is hung.</td>
<td>Use any of the following methods:</td>
</tr>
<tr>
<td></td>
<td>• If DSA Preboot is installed, restart the compute node and press F2 to start DSA Preboot and view the event logs.</td>
</tr>
<tr>
<td></td>
<td>• If DSA Preboot is not installed, insert the DSA Preboot CD and restart the compute node to start DSA Preboot and view the event logs.</td>
</tr>
<tr>
<td></td>
<td>• Alternatively, you can restart the compute node and press F1 to start the Setup utility and view the POST event log or system-event log. For more information, see “Viewing event logs through the Setup utility” on page 63.</td>
</tr>
</tbody>
</table>
Lenovo Dynamic System Analysis Preboot diagnostic program

Lenovo Dynamic System Analysis (DSA) Preboot diagnostic program collects and analyzes system information to aid in diagnosing compute node problems.

DSA Preboot performs the following tasks:

• Collects system information into a compressed XML file that you can send to Support
• Provides a bootable image that you can use to run extended hardware tests independent of the operating system or applications
• Collects the version and license information from local VMware ESXi hypervisor software

DSA Preboot might appear to be unresponsive when you start the program. This is normal operation while the program loads.

To diagnose and resolve DSA messages, see “DSA diagnostic test results” on page 66.

Running DSA Preboot

Use this information to run DSA Preboot.

To run the DSA Preboot diagnostic programs, complete the following steps:

1. If the compute node is running, turn off the compute node and all attached devices.
2. Turn on all attached devices; then, turn on the compute node.
3. When the prompt <F2> Diagnostics is displayed, press F2.

   Note: DSA Preboot might appear to be unresponsive for an unusual length of time when you start the program. This is normal operation while the program loads.
4. Select Quit to DSA to exit from the stand-alone memory diagnostic program.

   Note: After you exit from the stand-alone memory diagnostic environment, you must restart the compute node to access the stand-alone memory diagnostic environment again.
5. Enter gui to start the DSA graphical user interface, or select cmd to display the DSA interactive menu.
6. From the diagnostic programs screen, select the test that you want to run, and follow the instructions on the screen. For additional information, see the Dynamic System Analysis Installation and User’s Guide, which is available at https://support.lenovo.com/us/en/documents/LNVO-DSA.

Help for DSA is available. For help about the DSA CLI, enter help in the command line. For help with the DSA user interface, press F1. Pressing F1 within a help panel displays additional online documentation.

Diagnostic text messages

Use this information to understand the diagnostic text messages that are displayed while the tests are running.

A diagnostic text message contains one of the following results:

• Passed: The test was completed without any errors.
• Failed: The test detected an error.
• User Aborted: You stopped the test before it was completed.
• Not Applicable: You attempted to test a device that is not present in the compute node.
• **Aborted**: The test could not proceed because of the compute node configuration.

• **Warning**: The test could not be run. There was no failure of the hardware that was being tested, but there might be a hardware failure elsewhere, or another problem prevented the test from running; for example, there might be a configuration problem, or the hardware might be missing or is not being recognized.

The result is followed by an error code or other additional information about the error.

**Viewing the test results**

Use this information to view the test results.

You can use one of the following methods to access the test log when the tests are completed:

• From the DSA command line, issue the DSA CLI View command or select the **Diagnostic Event Log** option from the DSA graphical user interface (GUI).

• From the DSA interactive menu, select the **getextendedresults** option.

• From the DSA interactive menu, select the **View** option to view all of the collected results and error log data.

• In the DSA GUI, select **DSA Error Log** from the System Information page.

You can send the DSA error log file to Support to aid in diagnosing the compute node problems, or you can use the DSA CLI copy command to copy the log to an external USB device.

**DSA diagnostic test results**

After running the DSA diagnostic tests, use this information to resolve any issues that were found.

**DSA CPU stress test results**

The following messages can result when you run the CPU stress test.

**Test results for the DSA CPU stress test**

The following messages can result when you run the DSA CPU stress test.

User Response
Complete the following steps:
1. Turn off and restart the system.
2. Make sure that the DSA Diagnostic code is at the latest level.
3. Run the test again.
4. Check system firmware level and upgrade if necessary. The installed firmware level can be found in the DSA Diagnostic Event Log within the Firmware/VPD section for this component. The latest level firmware for this component can be found in reference to this system type at the IBM Support website: http://www.ibm.com/support/docview.wss?uid=psg1MIGR-4JTS2T.
5. Run the test again.
6. If the system has stopped responding, turn off and restart the system and then run the test again.
7. If failure remains, refer to "Troubleshooting by symptom" in the system "Installation and Service Guide" for the next corrective action.

User Response
Complete the following steps:
1. Perform the actions mentioned one at a time and try the test after each action.
2. If the problem remains, contact your technical-service representative.
3. Turn off the system and disconnect it from power. Wait for 45 seconds. Reseat DIMM(s).
   Reconnect it to power.
4. Make sure that DSA and BIOS/uEFI are at the latest level.
5. Replace any DIMMS(s) mentioned in error, one by one.
6. Make sure that all DIMMs are enabled in the Configuration/Setup Utility program.
7. If failure remains, refer to "Troubleshooting by symptom" in the system "Installation and Service Guide" for the next corrective action.

Event messages
Use this information to review event messages and resolve many errors.

Note: IMM and UEFI events related to communications errors can take up to 20 minutes to be displayed in the CMM event log.

IMM messages
When a hardware event is detected by the IMM2 on an x440 Compute Node Types 7167 and 2590, the IMM2 logs that event in the system-event log in the compute node. In addition, the IMM2 sends that event to the CMM and to the Lenovo XClarity Administrator or Flex System Manager management software (if available).

For each event code, the following fields are displayed:

Event identifier
A hexadecimal identifier that uniquely identifies an event or class of events. In this documentation, the event identifiers are prefixed with 0x and followed by eight characters.
Event description
The logged message string that appears for an event. When the event string is displayed in the system-event log, information such as a specific component is displayed. In this documentation, that additional information appears as variables, such as [arg1] or [arg2].

Explanation
Additional information to explain why the event occurred.

Severity
An indication of the level of concern for the condition. In the system-event log, the severity is abbreviated to the first character. The following severities can be displayed:

- **Info**: The event was recorded for audit purposes. This is usually a user action or a change of states that is normal behavior.
- **Warning**: The event is not as severe as an error, but if possible, the condition should be corrected before it becomes an error. It might also be a condition that requires additional monitoring or maintenance.
- **Error**: The event is a failure or critical condition that impairs service or an expected function.

Alert Category
Similar events are grouped in categories. The alert category is in the following format:

```
severity - device component
```

**severity** is one of the following severity levels:

- **Critical**: A key component in the server is no longer functioning.
- **Warning**: The event might progress to a critical level.
- **System**: The event is the result of a system error or a configuration change.

**device component** is the specific device in the compute node that caused the event to be generated.

Serviceable
Whether user action is required to correct the problem.

CIM Information
The prefix of the message ID and the sequence number that is used by the CIM message registry.

SNMP Trap ID
The SNMP trap ID that is found in the SNMP alert management information base (MIB).

Automatically notify Support
If this field is set to **Yes** and you have enabled Call Home on the Lenovo XClarity Administrator or Electronic Service Agent (ESA) on Flex System Manager management software (if available), Support will be notified automatically if the event is generated.

If the Lenovo XClarity Administrator or Flex System Manager management software is not available, you can enable Support from the CMM web interface.

While you wait for Support to call, you can perform the recommended actions for the event.

User response
The actions that you should perform to solve the event.

Perform the steps listed in this section in the order shown until the problem is solved. After you perform all of the actions that are described in this field, if you cannot solve the problem, contact Support.

**Note**: This list includes error codes and messages that might not apply to this machine type and model.
List of IMM events
This section lists all messages that can be sent from the IMM.

Critical - Voltage

SNMP Trap ID
1

CIM Information
Prefix: PLAT ID: 0480

User Response
Use one of the following procedures:
  – If the specified sensor is SysBrd 3.3V or SysBrd 5V, replace the system board.
– If the specified sensor is SysBrd 12V, check the Chassis Management Module or Flex System Manager event log for power-supply-related issues, and resolve those issues. If the problem remains, replace the system board.

- **80010202-2801ffff : Sensor Planar VBAT has detected low battery voltage.**
  The CMOS battery voltage has dropped below its specified threshold.

User Response
   Complete the following steps until the problem is solved:
   1. Check the Chassis Management Module or Flex System Manager event log for any fan- or cooling-related issues.
   2. Make sure that the airflow at the front and rear of the chassis is not obstructed and that fillers are in place and correctly installed.
   3. Make sure that the room temperature is within operating specifications.
   4. Make sure that the microprocessor 1 heat sink is securely installed.
   5. Make sure that the microprocessor 1 heat sink is installed correctly and the thermal material is correctly applied.
   6. Replace microprocessor 1.

• 806f0107-0302ffff : An over-temperature condition has been detected on [ProcessorElementName].

The temperature of microprocessor 2 has exceeded the critical level, causing a hard shutdown of the compute node.

Complete the following steps:
1. Check the CMM or FSM event log for any fan or cooling related issues.
2. Make sure that the airflow at the front and rear of the chassis is not obstructed and that fillers are in place and correctly installed.
3. Make sure that the room temperature is within operating specifications.
4. Make sure that the DIMM baffles are in place.
5. If the problem persists and there are no other DIMMs with the same indication, replace the DIMM.

IMM Events that automatically notify Support
You can configure the IBM Flex System Manager or the CMM to automatically notify Support (also known as call home) if certain types of errors are encountered. If you have configured this function, see the table for a list of events that automatically notify Support.

Table 9. Events that automatically notify Support

<table>

UEFI diagnostic codes

UEFI diagnostic codes can be generated when the compute node starts or while the compute node is running. UEFI diagnostic codes are logged in the IMM event log in the compute node.

For each event code, the following fields are displayed:

**Event identifier**
An identifier that uniquely identifies an event.

**Event description**
The logged message string that appears for an event.

**Explanation**
Additional information to explain why the event occurred.

**Severity**
An indication of the level of concern for the condition. In the event log, the severity is abbreviated to the first character.

- **Info**: The event was recorded for audit purposes, usually a user action or a change of states that is normal behavior.
- **Warning**: The event is not as severe as an error, but if possible, the condition should be corrected before it becomes an error. It might also be a condition that requires additional monitoring or maintenance.
- **Error**: The event is a failure or critical condition that impairs service or an expected function.

**Alert Category**
Similar events are grouped in categories. The alert category is in the following format:

```
severity - device
```

*severity* is one of the following severity levels:

- **Critical**: A key component in the server is no longer functioning.
- **Warning**: The event might progress to a critical level.
- **System**: The event is the result of a system error or a configuration change.

*device component* is the specific device in the compute node that caused the event to be generated.

**User response**
The actions that you should perform to resolve the event.

Perform the steps listed in this section in the order shown until the problem is solved. After you perform all of the actions that are described in this field, if you cannot solve the problem, contact Support.

**UEFI diagnostic code fields**
For each event code, the following fields are displayed:

**Event identifier**
An identifier that uniquely identifies an event.

**Event description**
The logged message string that appears for an event.

**Explanation**
Additional information to explain why the event occurred.

**Severity**
An indication of the level of concern for the condition. The severity is abbreviated in the event log to the first character. The following severities can be displayed.

Table 10. Severity levels

<table>
<thead>
<tr>
<th>Severity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Informational</td>
<td>An informational message is something that was recorded for audit purposes, usually a user action or a change of states that is normal behavior.</td>
</tr>
<tr>
<td>Warning</td>
<td>A warning is not as severe as an error, but if possible, the condition should be corrected before it becomes an error. It might also be a condition that requires additional monitoring or maintenance.</td>
</tr>
<tr>
<td>Error</td>
<td>An error typically indicates a failure or critical condition that impairs service or an expected function.</td>
</tr>
</tbody>
</table>

User response
Indicates what actions you should perform to resolve the event.

Perform the steps listed in this section in the order shown until the problem is solved. After you perform all of the actions that are described in this field, if you cannot solve the problem, contact Support.

Finding the UEFI diagnostic code
This topic provides information about finding the UEFI diagnostic code.

Several methods are available to locate the UEFI diagnostic code based on the systems-management platform you are using or if you are viewing test results generated by the DSA Preboot diagnostic program.

Note: Not all events have a UEFI diagnostic code associated with the event.

Table 11. Finding the UEFI diagnostic code

<table>
<thead>
<tr>
<th>Interface to the UEFI diagnostic code</th>
<th>Action</th>
</tr>
</thead>
</table>
| Logged on to Flex System Manager management software (if installed) | 1. Go to the Problems (Active Status) view and click the name of the problem.  
2. Click on the Recommendations tab and locate the UEFI diagnostic code. |
| Logged on to the IMM or CMM web interface | 1. Open the Events menu and click Event Log.  
2. Click more next to the event message and locate the UEFI diagnostic code. |
| Viewing the DSA Preboot diagnostic program test results | 1. Go to the Chassis Event log.  
2. Scroll to the right and look in the Auxiliary Data Column to find the UEFI diagnostic code. |

List of UEFI events
This section lists all messages that can be sent from UEFI.

- I.11002 [I.11002] A processor mismatch has been detected between one or more processors in the system. : One or More Mismatched Processors Detected
  
  **Severity**  
  Info
User Response
Complete the following steps:

1. This message could occur with messages about other processor configuration problems. Resolve those messages first.
2. If the problem persists, ensure that matching processors are installed (i.e., matching option part numbers, etc)
3. Verify that the processors are installed in the correct sockets. If not, correct that problem.
4. Check the IBM support site for an applicable service bulletin or firmware update that applies to this processor error.
5. Replace mismatching processor. Inspect the processor socket and replace the system board first if the socket is damaged.

I.18007 [I.18007] A power segment mismatch has been detected for one or more processor packages. : Processors have mismatched Power Segments

Severity
Info

User Response
Complete the following steps:
1. Processors installed do not have the same power requirements
2. Ensure that all Processors have matching power requirements (such as 65, 95, or 130 Watts)
3. If power requirements match, check the IBM support site for an applicable service bulletin or firmware update that applies to this processor error.
4. Replace the processor. Inspect the processor socket and replace the system board first if the socket is damaged

The failing DIMM within the channel could not be determined.[S.51003] An uncorrectable memory error has been detected during POST. Fatal Memory Error Occurred

Severity
Error

User Response
Complete the following steps:
1. Prior to replacing memory DIMM, refer to TIP H212154 for minimum code level.
2. If the compute node has recently been installed, moved, serviced, or upgraded, verify that the DIMM is properly seated and visually verify that there is no foreign material in any DIMM connector on that memory channel. If either of these conditions is found, correct and retry with the same DIMM. (Note: The event Log might contain a recent 00580A4 event denoting detected change in DIMM population that could be related to this problem.)
3. If no problem is observed on the DIMM connectors or the problem persists, replace the DIMM identified by LightPath and/or event log entry.
4. If problem recurs on the same DIMM connector, replace the other DIMMs on the same memory channel.
5. Check the IBM support site for an applicable service bulletin or firmware update that applies to this memory error.
6. If problem recurs on the same DIMM connector, inspect connector for damage. If found, replace the system board.
7. Replace the affected Processor.
8. Replace system board.

• S.51009 [S.51009] No system memory has been detected. : No Memory Detected

Severity
Error

User Response
Complete the following steps:

1. If any memory errors are logged other than this one, take actions indicated for those codes first.

2. If no other memory diagnostic codes appear in the logs, verify that all DIMM connectors are enabled using the Setup utility or the Advanced Settings Utility (ASU).

3. If the problem remains, shut down and remove node from chassis and physically verify that one or more DIMMs are installed and that all DIMMs are installed in the correct population sequence.

4. If DIMMs are present and properly installed, check for any lit DIMM-connector LEDs, and if found, reseat those DIMMs.

5. Reinstall node in chassis, power on node, then check logs for memory diagnostic codes.

6. If the problem remains, replace the processor.

7. If the problem remains, replace the system board.

• S.58008 [S.58008] A DIMM has failed the POST memory test. : DIMM Failed Memory Test

Severity
Error

User Response
Complete the following steps:

1. Prior to replacing memory DIMM, refer to TIP H212154 for minimum code level.

2. You must AC-cycle the system to re-enable the affected DIMM connector or re-enable manually using the Setup utility.

3. If the compute node has been recently installed, serviced, moved, or upgraded, check to ensure that DIMMs are firmly seated and that no foreign material can be seen in the DIMM connector. If either condition is observed, correct and retry with the same DIMM. (Note: The event Log might contain a recent 00580A4 event denoting detected change in DIMM population that could be related to this problem.)

4. If problem persists, replace the DIMM identified by LightPath and/or event log entry.
5. If problem recurs on the same DIMM connector, swap the other DIMMs on the same memory channel across channels one at a time to a different memory channel or processor. If problem follows a moved DIMM to a different memory channel, replace that DIMM.

6. Check the IBM support site for an applicable service bulletin or firmware update that applies to this memory error.

7. If problem stays with the original DIMM connector, re-inspect DIMM connector for foreign material and remove, if found. If connector is damaged, replace system board.

8. Remove the affected processor and inspect the processor socket pins for damaged or misaligned pins. If damage is found, or this is an upgrade processor, replace the system board. If there are multiple processors, swap them to move affected processor to another processor socket and retry. If problem follows the affected processor (or there is only one processor), replace the affected processor.

9. Replace the system board.

1. Check the IBM support site for an applicable service bulletin or firmware update that applies to this error.
2. Inspect the processor socket for foreign debris or damage. If debris is found, remove the debris.
3. If error recurs, or socket damage is found, replace the system board.

• **W.58001 [W.58001]** The PFA Threshold limit (correctable error logging limit) has been exceeded on DIMM number % at address %. MC5 Status contains % and MC5 Misc contains %. : DIMM PFA Threshold Exceeded

**Severity**
Warning

**User Response**
Complete the following steps:
1. Prior to replacing memory DIMM, refer to TIP H212154 for minimum code level.
2. If the compute node has recently been installed, moved, serviced, or upgraded, verify that the DIMM is properly seated and visually verify that there is no foreign material in any DIMM connector on that memory channel. If either of these conditions is found, correct and retry with the same DIMM. (Note: The event Log might contain a recent 00580A4 event denoting detected change in DIMM population that could be related to this problem.)
3. Check the IBM support site for an applicable firmware update that applies to this memory error. The release notes will list the known problems the update addresses.
4. If the previous steps do not resolve the problem, at the next maintenance opportunity, replace the affected DIMM (as indicated by LightPath and/or failure log entry).
5. If PFA re-occurs on the same DIMM connector, swap the other DIMMs on the same memory channel one at a time to a different memory channel or processor. If PFA follows a moved DIMM to any DIMM connector on the different memory channel, replace the moved DIMM.
6. Check the IBM support site for an applicable Service Bulletins (Service bulletins) that applies to this memory error. (Link to IBM support service bulletins)
7. If problem continues to re-occur on the same DIMM connector, inspect DIMM connector for foreign material and remove, if found. If connector is damaged, replace system board.
8. Remove the affected processor and inspect the processor socket pins for damaged or misaligned pins. If damage is found or the processor is an upgrade part, replace the system board.
9. Replace affected processor.
10. Replace the system board.

**Troubleshooting by symptom**

Use this information to find solutions to problems that have identifiable symptoms.

To use the symptom-based troubleshooting tables in this section, complete the following steps:

1. Check the IMM event log and follow the suggested actions to resolve any event codes (see “IMM event log” on page 63).
2. Find the symptoms that you are experiencing in the troubleshooting tables in this section and follow the suggested actions to resolve any problems.

**Compute node start problems**

Use this information to solve compute node start problems.

Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved. See Chapter 5 “Parts listing, Types 7167 and 2590” on page 51 to determine which components are Tier 1 customer replaceable units (CRUs) and which components are Tier 2 customer replaceable units (CRUs).

<table>

### Connectivity problems

Use this information to solve connectivity problems.

#### Cannot communicate with the Flex System Manager management node

Use the information in this section to troubleshoot the compute node when you cannot communicate with the Flex System Manager management node on the data network.

Complete the following steps until the problem is solved:

1. Make sure that all ports for the connection path are enabled and that you can ping the Flex System Manager management node. If you are unable to ping the Flex System Manager management node, see “Cannot ping the Flex System Manager management node on the data network” on page 807.
2. Make sure that the protocols you are using are enabled.

   **Note:** By default, only secure protocols are enabled, for example, SSH and HTTPS.

3. If you cannot log into the Flex System Manager management node, see “Cannot log in to the Flex System Manager management node” on page 803.

#### Cannot communicate with the CMM

Use the information in this section to troubleshoot the compute node when you cannot communicate with the CMM.

**Action**

**Note:** Communications errors from compute nodes can take up to 20 minutes to appear in the CMM event log.

Complete the following steps until the problem is solved:

1. Make sure that the protocols that you are using are enabled.

   **Note:** By default, only secure protocols, such as, SSH and HTTPS, are enabled.

2. Use a serial cable to connect to the I/O module to further isolate the problem.
3. Reset the CMM to the default settings by pressing the reset button on the CMM.
Cannot communicate with the I/O module
Use the information in this section to troubleshoot the compute node when you cannot communicate with the I/O module.

Action
Complete the following steps until the problem is solved:
1. Make sure that the protocols that you are using are enabled.
   
   Note: By default, only secure protocols, such as, SSH and HTTPS, are enabled.
2. Use a serial cable to connect to the I/O module to further isolate the problem.

One or more compute nodes are unable to communicate with SAN
Use the information in this section to troubleshoot one or more compute nodes are unable to communicate with SAN.

- Make sure that:
  1. The I/O module is powered on and the appropriate ports are enabled on the I/O module.
  2. The CMM has reported that the I/O module has completed POST and that no errors have been reported in the logs.
  3. The SAN device is powered on and is functional.
  4. All cables between the I/O module and the SAN device are properly connected and secure and that the activity LEDs are lit on the applicable ports.

- See the documentation for the I/O module for additional information about troubleshooting SAN connectivity or network connectivity issues.

Complete the following steps until the problem is solved:

Cannot connect during initial setup
Use the information in this section to troubleshoot the compute node when you cannot connect during initial setup.

One compute node is unable to connect during the initial setup
Use the information in this section to troubleshoot one compute node that is unable to connect during the initial setup.

Complete the following steps until the problem is solved:
1. Make sure that:
   a. The I/O module is powered on and the applicable ports are enabled on the I/O module.
   b. All cables between the I/O module and the network device (switch or router) are properly connected and secure and that the activity LEDs are lit on the applicable ports.
2. From the compute node operating system, verify the network settings, such as IP address, subnet mask (if you are using IPv4), DHCP settings, and vLAN settings, to ensure that the settings match the settings of the network device. See the documentation for the operating system for information about checking network settings.
3. From the compute node operating system, make sure that the network device is active. See the documentation for the operating system for information about viewing network devices.
4. Check the Support website for any firmware updates that might apply to this issue. You can view the release notes for a firmware update to determine the issues that are addressed by the update.
5. Remove the compute node from the chassis and check the connectors at the back of the node for bent pins. If the pins are bent, contact Support. See “Removing a compute node from a chassis” on page 828.

6. Install the compute node in another compute node bay to see whether the problem remains. See “Installing a compute node in a chassis” on page 829. If the problem persists, make sure that this compute node is connected to a port that has been enabled and that the vLAN settings enable that port to connect to the network.

7. Check http://www.ibm.com for any service bulletins that are related to network connectivity.

8. (Trained service technician only) Complete the following steps:
   a. Force the link/duplex speed.
   b. Check the connectors on the I/O module to ensure that there are no bent pins.
   c. Check the connectors on the chassis midplane to ensure there are no bent pins. See the...
   d. Remove the I/O module and install a working I/O module in the same I/O bay.
   e. If the problem is solved, replace the I/O module that you removed.
   f. If the problem remains, replace the chassis midplane.

One compute node experiences a sudden loss of connectivity
Use the information in this section to troubleshoot one compute node that experiences a sudden loss of connectivity.

The event is logged in the event log. See the event log for the management node (if available) or see the event log of the CMM to determine what actions might be required to resolve this issue. See “IMM event log” on page 63.

Two or more compute nodes are unable to communicate during initial setup
Use the information in this section to troubleshoot two or more compute nodes that are unable to communicate during initial setup.

Complete the following steps until the problem is solved:
1. If you have just updated the firmware for one or more devices in the chassis (such as an I/O module or CMM), install the previous level of firmware.

2. Make sure that:
   a. The I/O module is powered on and the applicable ports are enabled on the I/O module.
   b. All cables between the I/O module and the network device (switch or router) are properly connected and secure and that the activity LEDs are lit on the applicable ports.

3. From the compute node operating system, verify the network settings, such as IP address, subnet mask (if you are using IPv4), DHCP settings, and vLAN settings, to ensure that the settings match the settings of the network device. See the documentation for the operating system for information about checking network settings.

4. From the compute node operating system, make sure that the network device is active. See the documentation for the operating system for information about viewing network devices.

5. Check http://www.ibm.com for any firmware updates that might apply to this issue. You can view the release notes for a firmware update to determine the issues that are addressed by the update.

6. Check the Support website for any service bulletins that are related to network connectivity.

7. (Trained service technician only) Complete the following steps:
   a. Force the link/duplex speed.
   b. Check the connectors on the I/O module to ensure that there are no bent pins.
c. Check the connectors on the chassis midplane to ensure there are no bent pins. See the.

d. Remove the I/O module and install a working I/O module in the same I/O bay.

e. If the problem is solved, replace the I/O module that you removed.

f. If the problem persists, replace the chassis midplane.

**Two or more compute nodes experience a sudden loss of connectivity**

Use the information in this section to troubleshoot two or more compute nodes that experience a sudden loss of connectivity.

The event is logged in the event log. See the event log for the management node (if available) or see the event log of the CMM to determine what actions might be required to resolve this issue. See “IMM event log” on page 63.

**Cannot log in**

Use the information in this section to troubleshoot the compute node when you cannot log in to the management node, the CMM, or the I/O module.

**Cannot log in to the Flex System Manager management node**

Use the information in this section to troubleshoot the compute node when you cannot log in to the management node.

**Action**

Complete the following steps until the problem is solved:

1. Make sure that you are using the correct password and that the capitals lock is off.
2. Contact Support for further assistance if you have forgotten the password.

**Cannot log in to the CMM**

Use the information in this section to troubleshoot the compute node when you cannot log in to the CMM.

**Action**

Complete the following steps until the problem is solved:

1. Make sure that you are using the correct password and that the capitals lock is off.
2. Restore the CMM default settings by pressing the reset button on the CMM.

**Cannot log in to the I/O module**

Use the information in this section to troubleshoot the compute node when you cannot log in to the I/O module.

**Action**

Complete the following steps until the problem is solved:

1. Make sure that you are using the correct password and that the capitals lock is off.
2. Contact Support for further assistance if you have forgotten the password.

**Cannot ping the CMM on the management network**

Use the information in this section to troubleshoot the compute node when one or more compute nodes cannot ping the CMM on the management network.
Single node cannot ping the CMM in the same chassis

Use the information in this section to troubleshoot a single compute node that cannot ping the CMM on the management network in the same chassis.

Action

Complete the following steps until the problem is solved:

1. Make sure that the Chassis Management Module is powered on and the applicable ports are enabled on the CMM.
2. Make sure that the compute node IMM has acquired an IP address from the CMM by using the Setup utility on the node.

   **Note:** If the CMM recently lost connection to the DCHP server, you must reset the IMM by using the CMM interface so that a new IP address can be acquired.

3. In the CMM user interface, click **Chassis Management > Component IP Configuration** and make sure that the IP address that is listed is the same as the IP address that is displayed in the Setup utility. If it is not the same IP address, configure the IMM network settings correctly or reset the IMM to automatically acquire a new IP address.

4. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any firmware updates that might apply to this problem. You can view the release notes for a firmware update to determine the issues that the update addresses.

5. Remove the compute node from the chassis and check the connectors on the back of the node for bent pins. If the pins are bent, contact Support.

6. Install the compute node in another node bay to determine whether the problem remains. If the problem remains, make sure that the compute node is connected to a port that has been enabled and that the vLAN settings allow that port to connect to the network.

7. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any service bulletins that are related to network connectivity.

8. (Trained service technician only) Complete the following steps:
   a. Force the link/duplex speed.
   b. Check the connectors on the I/O module to make sure that no pins are bent.
   c. Check the connectors on the chassis midplane to make sure that no pins are bent.
   d. Remove the CMM and install a working CMM in the same bay.
      * If the problem is solved, replace the CMM that you removed.
      * If the problem remains, replace the chassis midplane.

Multiple nodes cannot ping the CMM in the same chassis

Use the information in this section to troubleshoot multiple nodes that cannot ping the CMM on the management network in the same chassis.

Action

Complete the following steps until the problem is solved:

1. Make sure that the Chassis Management Module is powered on and the applicable ports are enabled on the CMM. If the CMM is hung, reset the CMM.
2. Reset the CMM.
3. Check for firmware updates for the CMM.
4. Reset the CMM to factory defaults and attempt to discover the nodes again. Allow enough time for the IMM to acquire a network address.
5. Replace the CMM.
6. Make sure that the compute node IMM has acquired an IP address from the CMM by using the Setup utility on the node.

   **Note:** If the CMM recently lost connection to the DCHP server, you must reset the IMM by using the CMM interface so that a new IP address can be acquired.

7. In the CMM user interface, click **Chassis Management > Component IP Configuration** and make sure that the IP address that is listed is the same as the IP address that is displayed in the Setup utility. If it is not the same IP address, configure the IMM network settings correctly or reset the IMM to automatically acquire a new IP address.

8. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any firmware updates that might apply to this problem. You can view the release notes for a firmware update to determine the issues that the update addresses.

9. Remove the compute node from the chassis and check the connectors on the back of the node for bent pins. If the pins are bent, contact Support.

10. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any service bulletins that are related to network connectivity.

11. (Trained service technician only) Complete the following steps:
    a. Force the link/duplex speed.
    b. Check the connectors on the CMM to make sure that no pins are bent.
    c. Check the connectors on the chassis midplane to make sure that no pins are bent.
    d. Remove the CMM and install a working CMM in the same bay.
       * If the problem is solved, replace the CMM that you removed.
       * If the problem remains, replace the chassis midplane.

**CMM cannot ping the CMM in a different chassis**

Use the information in this section to troubleshoot a CMM that cannot ping the CMM in a different chassis.

**Action**

Complete the following steps until the problem is solved:

1. Make sure that the Chassis Management Modules are powered on and the applicable ports are enabled.
   a. If the CMM is powered on and hung, reset the CMM.
   b. Make sure that the IMM, the management node, and the CMMs are all on the same subnet.

2. Verify that the cables between the CMMs and the top-of-rack switch are correctly connected and that the activity LEDs are lit on the applicable ports.

3. Make sure that the management node has a correct IP address and is on the same subnet as the CMMs.

4. Make sure that the compute node IMM has acquired an IP address from the CMM by using the Setup utility on the node.

   **Note:** If the CMM recently lost connection to the DCHP server, you must reset the IMM by using the CMM interface so that a new IP address can be acquired.

5. In the CMM user interface, click **Chassis Management > Component IP Configuration** and make sure that the IP address that is listed is the same as the IP address that is displayed in the Setup utility. If it is not the same IP address, configure the IMM network settings correctly or reset the IMM to automatically acquire a new IP address.

6. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any firmware updates that might apply to this problem. You can view the release notes for a firmware update to determine the issues that the update addresses.

7. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any service bulletins that are related to network connectivity.

8. Remove the compute node from the chassis and check the connectors on the back of the node and on the chassis midplane for bent pins. If the pins are bent, contact Support.
9. (Trained service technician only) Complete the following steps:
   a. Force the link/duplex speed.
   b. Check the connectors on the nodes and on the chassis midplane to make sure that no pins are bent.
   c. Replace the I/O expansion card in the management node.
   d. Replace the management node system-board assembly.
   e. Replace the management node.

Cannot ping the I/O module
Use the information in this section to troubleshoot the compute node when one or more compute nodes cannot ping the I/O module.

Single node cannot ping the I/O module
Use the information in this section to troubleshoot a single compute node that cannot ping the I/O module.

Action
Complete the following steps until the problem is solved:

1. If you have recently updated the firmware for one or more devices in the chassis (I/O module) and have verified the network settings, install the previous level of firmware.
2. Make sure that the I/O module is powered on and the applicable ports are enabled on the I/O module.
3. Make sure that all network cables are correctly connected and that the activity LEDs are lit. If the cables are correctly connected and the LEDs are not lit, replace the cable.
4. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any firmware updates that might apply to this problem. You can view the release notes for a firmware update to determine the issues that are addressed by the update.
5. Remove the node from the chassis and check the connectors at the back of the node for bent pins. If the pins are bent, go to [http://www.lenovo.com/support](http://www.lenovo.com/support) to submit a service request.
6. Install the compute node in another node bay, if one is available. If the problem remains, make sure that the compute node is connected to a port that has been enabled and that the vLAN settings allow that port to connect to the network.
7. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any service bulletins that are related to I/O-module connectivity.
8. If the problem remains, replace the I/O module, and go to [http://www.lenovo.com/support](http://www.lenovo.com/support) to submit a service request.
9. (Trained service technician only) Complete the following steps:
   a. Force the link/duplex speed.
   b. Check the connectors on the I/O module to make sure that no pins are bent.
   c. Check the connectors on the chassis midplane to make sure that no pins are bent.
   d. Remove the I/O module and install a working I/O module in the same I/O bay.
      • If the problem is solved, replace the I/O module that you removed.
      • If the problem remains, replace the chassis midplane.

Multiple nodes cannot ping the I/O module
Use the information in this section to troubleshoot multiple nodes that cannot ping the I/O module.

Action
Complete the following steps until the problem is solved:
1. If you have recently updated the firmware for one or more devices in the chassis (I/O module or CMM), install the previous level of firmware.
2. Make sure that the I/O module is powered on and the applicable ports are enabled on the I/O module.
3. Make sure that all network cables are correctly connected and that the activity LEDs are lit.
4. From the compute node operating system, verify that the network device is active. Check also the network settings, such as IP address, subnet mask (if you are using IPv4), DNS, DHCP settings, and vLAN settings to make sure that the settings match the settings of the network device. See the documentation that comes with the operating system for information about viewing network devices and checking the network settings.
5. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any firmware updates that might apply to this problem. You can view the release notes for a firmware update to determine the issues that are addressed by the update.
6. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any service bulletins that are related to network connectivity.
7. (Trained service technician only) Complete the following steps:
   a. Force the link/duplex speed.
   b. Check the connectors on the I/O module to make sure that no pins are bent.
   c. Check the connectors on the chassis midplane to make sure that no pins are bent.
   d. Remove the I/O module and install a working I/O module in the same I/O bay.
      - If the problem is solved, replace the I/O module that you removed.
      - If the problem remains, replace the chassis midplane.

**Cannot ping the Flex System Manager management node on the data network**

Use the information in this section to troubleshoot the compute node when one or more compute nodes cannot ping the management node on the data network.

**Single node cannot ping the management node in the same chassis**

Use the information in this section to troubleshoot a single compute node that cannot ping the Flex System Manager management node in the same chassis on the data network.

**Action**

Complete the following steps until the problem is solved:

1. Make sure that the management node is powered on and is not hung, by logging in to the management node. If you are unable to log in from the management network, attempt to log in from the data network. If the management node is powered on and hung, perform a virtual reseat of the management node from the CMM.
2. Make sure that the I/O module is powered on and is not hung, by pinging the I/O module from the management node. If the I/O module is powered on and hung, reset the I/O module. Make sure that the correct ports are enabled for the node on the I/O module.
3. Make sure that the compute node is the only one in the chassis that the management node cannot ping. If it is not, follow the steps in “Multiple nodes cannot ping the management node in the same chassis” on page 808.
4. Make sure that the configuration settings in the node are correct and that the port is enabled.
5. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any firmware updates that might apply to this issue. You can view the release notes for a firmware update to determine the issues that are addressed by the update.
6. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any service bulletins that are related to network connectivity.
7. Remove the compute node and make sure that the connectors on the chassis midplane and the node are not damaged.
8. (Trained service technician only) Complete the following steps:
   a. Force the link/duplex speed.
   b. Check the connectors on the node and the chassis midplane to make sure that no pins are bent.
   c. Replace the base assembly in the compute node.

Single node cannot ping the management node in a different chassis
Use the information in this section to troubleshoot a single compute node that cannot ping the Flex System Manager management node in a different chassis on the data network.

Action
Complete the following steps until the problem is solved:
1. Make sure that the management node is powered on and is not hung, by logging in to the management node. If you are unable to log in from the management network, attempt to log in from the data network. If the management node is powered on and hung, perform a virtual reseat of the management node from the CMM.
2. Make sure that the I/O module is powered on and is not hung, by pinging the I/O module from the management node. If the I/O module is powered on and hung, reset the I/O module. Make sure that the correct ports are enabled for the node on the I/O module.
3. Make sure that the compute node is the only one in the chassis that the management node cannot ping. If it is not, follow the steps in “Multiple nodes cannot ping the management node in the same chassis” on page 808.
4. Make sure that the IP configuration settings on the node are correct and that the port is enabled.
5. Check http://www.lenovo.com/support for any firmware updates that might apply to this issue. You can view the release notes for a firmware update to determine the issues that are addressed by the update.
6. Check http://www.lenovo.com/support for any service bulletins that are related to network connectivity.
7. Remove the compute node and make sure that the connectors on the midplane and the node are not damaged.
8. (Trained service technician only) Complete the following steps:
   a. Force the link/duplex speed.
   b. Check the connectors on the node and the chassis midplane to make sure that no pins are bent.
   c. Replace the system-board assembly in the compute node.

Multiple nodes cannot ping the management node in the same chassis
Use the information in this section to troubleshoot multiple nodes that cannot ping the Flex System Manager management node in the same chassis on the data network.

Action
Complete the following steps until the problem is solved:
1. Make sure that the management node is powered on and is not hung, by logging in to the management node. If you are unable to log in from the management network, attempt to log in from the data network. If the management node is powered on and hung, perform a virtual reseat of the management node from the CMM.
2. Make sure that the I/O module is powered on and is not hung, by pinging the I/O module from the management node. If the I/O module is powered on and hung, reset the I/O module. Make sure that the correct ports are enabled for the node on the I/O module.
3. Make sure that the management network port (eth1) is enabled in the management node. Make sure that the port configuration settings are correct for the data network.
4. Make sure that the configuration settings for each node are correct and that the data network ports are enabled.

5. Make sure that the configuration settings in the I/O module are correct and that the applicable ports are enabled for your compute nodes and the management node on the I/O module. If the problem remains, complete the following steps:
   a. Restart the I/O module.
   b. Check http://www.lenovo.com/support for any firmware updates that might apply to this issue. You can view the release notes for a firmware update to determine the issues that are addressed by the update.
   c. Perform a virtual reseat of the I/O module.
   d. Replace the I/O module.

6. Check http://www.lenovo.com/support for any service bulletins that are related to network connectivity.

7. Remove the management node and make sure that the connectors on the chassis midplane and the management node are not damaged.

8. (Trained service technician only) Complete the following steps:
   a. Force the link/duplex speed.
   b. Check the connectors on the nodes and the chassis midplane to make sure that no pins are bent.
   c. Replace the I/O expansion card in the management node.
   d. Replace the system-board assembly in the management node.

Multiple nodes cannot ping the management node in a different chassis
Use the information in this section to troubleshoot multiple nodes that cannot ping the Flex System Manager management node in a different chassis on the data network.

Action

Complete the following steps until the problem is solved:

1. Make sure that the management node is powered on and is not hung, by logging in to the management node. If you are unable to log in from the management network, attempt to log in from the data network. If the management node is powered on and hung, perform a virtual reseat of the management node from the CMM.

2. Make sure that the I/O module is powered on and is not hung, by pinging the I/O module from the management node. If the I/O module is powered on and hung, reset the I/O module. Make sure that the correct ports are enabled for the node on the I/O module.

3. Make sure that the management network port (eth1) in the management node is enabled. Make sure that the port configuration settings are correct for the data network.

4. Make sure that the configuration settings for each node are correct and that the data network ports are enabled.

5. Make sure that the configuration settings in the I/O module are correct and that the applicable ports are enabled for your compute nodes and the management node on the I/O module. If the problem remains, complete the following steps:
   a. Restart the I/O module.
   b. Check http://www.lenovo.com/support for any firmware updates that might apply to this issue. You can view the release notes for a firmware update to determine the issues that are addressed by the update.
   c. Perform a virtual reseat of the I/O module.
   d. Replace the I/O module.

6. Check http://www.lenovo.com/support for any service bulletins that are related to network connectivity.
7. Remove the management node and make sure that the connectors on the chassis midplane and the node are not damaged.

8. (Trained service technician only) Complete the following steps:
   a. Force the link/duplex speed.
   b. Check the connectors on the nodes and the chassis midplane to make sure that no pins are bent.
   c. Replace the I/O expansion card in the management node.
   d. Replace the system-board assembly in the management node.

**Multiple nodes cannot ping the management node in the same chassis or a different chassis**

Use the information in this section to troubleshoot multiple nodes that cannot ping the Flex System Manager management node in the same chassis or a different chassis on the data network.

**Action**

Complete the following steps until the problem is solved:

1. Follow the steps in “Multiple nodes cannot ping the management node in the same chassis” on page 808.
2. Follow the steps in “Multiple nodes cannot ping the management node in a different chassis” on page 809.

**Cannot ping the Flex System Manager management node on the management network**

Use the information in this section to troubleshoot the compute node when one or more compute nodes cannot ping the management node on the management network.

**Single node cannot ping the management node in the same chassis**

Use the information in this section to troubleshoot a single compute node that cannot ping the Flex System Manager management node in the same chassis on the management network.

**Action**

Complete the following steps until the problem is solved:

1. Make sure that the management node is powered on and is not hung, by logging in to the management node. If you are unable to log in from the management network, attempt to log in from the data network. If the management node is powered on and hung, perform a virtual reseat of the management node from the CMM.
2. Make sure that the CMM is powered on and is not hung, by pinging the CMM from the management node. If the CMM is powered on and hung, reset the CMM. Make sure that the IMM, the management node, and CMM are all on the same subnet.
3. Make sure that the compute node is the only one in the chassis that the management node cannot ping. If it is not, follow the steps in “Multiple nodes cannot ping the management node in the same chassis” on page 812. Make sure that the compute node appears on the chassis map (it might not be fully discovered by the management node software).
4. Make sure that the system-management processor in each compute node has a valid IP address by checking the chassis map of the remote chassis.
   
   **Note:** If the CMM recently lost connection to the DCHP server, you must reset the IMM by using the CMM interface so that a new IP address can be acquired.
5. In the CMM user interface, click **Chassis Management > Component IP Configuration** and make sure that the IP address that is listed is the same as the IP address that is displayed in the Setup utility. If it is not the same, configure the IMM network settings correctly.
6. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any firmware updates that might apply to this issue. You can view the release notes for a firmware update to determine the issues that are addressed by the update.

7. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any service bulletins that are related to network connectivity.

8. Remove the compute node and make sure that the connectors on the chassis midplane and the node are not damaged.

9. (Trained service technician only) Complete the following steps:
   a. Force the link/duplex speed.
   b. Check the connectors on the node and the chassis midplane to make sure that no pins are bent.
   c. Replace the compute node.

**Single node cannot ping the management node in a different chassis**

Use the information in this section to troubleshoot a single compute node that cannot ping the Flex System Manager management node in a different chassis on the management network.

**Action**

Complete the following steps until the problem is solved:

1. Make sure that the management node is powered on and is not hung, by logging in to the management node. If you are unable to log in from the management network, attempt to log in from the data network. If the management node is powered on and hung, perform a virtual reseat of the management node from the CMM.

2. Make sure that the CMM is powered on and is not hung, by pinging the CMM from the management node:
   a. If the CMM is powered on and hung, reset the CMM
   b. Make sure that the IMM, the management node, and CMM are all on the same subnet.

3. Make sure that the compute node is the only one in the chassis that the management node cannot ping. If it is not, follow the steps in “Multiple nodes cannot ping the management node in the same chassis” on page 812. Make sure that the compute node appears on the chassis map (it might not be fully discovered by the management node software).

4. Make sure that the IMM has acquired an IP address from the CMM by using the Setup utility on the compute node.

   **Note:** If the CMM recently lost connection to the DCHP server, you must reset the IMM by using the CMM interface so that a new IP address can be acquired.

5. Make sure that the system-management processor in each compute node has a valid IP address by checking the chassis map of the remote chassis.

   **Note:** If the CMM recently lost connection to the DCHP server, you must reset the IMM by using the CMM interface so that a new IP address can be acquired.

6. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any firmware updates that might apply to this issue. You can view the release notes for a firmware update to determine the issues that are addressed by the update.

7. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any service bulletins that are related to network connectivity.

8. Remove the compute node and make sure that the connectors on the chassis midplane and the node are not damaged.

9. (Trained service technician only) Complete the following steps:
   a. Check the connectors on the node and the chassis midplane to make sure that no pins are bent.
   b. Replace the base assembly in the compute node.
Multiple nodes cannot ping the management node in the same chassis

Use the information in this section to troubleshoot multiple nodes that cannot ping the Flex System Manager management node in the same chassis on the management network.

**Action**

Complete the following steps until the problem is solved:

1. Make sure that the management node is powered on and is not hung, by logging in to the management node. If you are unable to log in from the management network, attempt to log in from the data network. If the management node is powered on and hung, perform a virtual reseat of the management node from the CMM.
2. Make sure that the CMM is powered on and is not hung, by pinging the CMM from the management node:
   a. If the CMM is powered on and hung, reset the CMM.
   b. Make sure that the IMM, the management node, and CMM are all on the same subnet.
3. Make sure that the management network port (eth0) in the management node is enabled.
4. Make sure that the management node has an IP address, is on the same subnet as the CMM, and is able to ping the CMM.
5. Make sure that the system-management processor in each compute node has a valid IP address by checking the chassis map of the remote chassis.

   **Note:** If the CMM recently lost connection to the DCHP server, you must reset the IMM by using the CMM interface so that a new IP address can be acquired.

   If a system-management processor does not have a valid IP address, complete the following steps:
   a. Restart the CMM.
   b. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any firmware or software updates that might apply to this issue. You can view the release notes for a firmware update to determine the issues that are addressed by the update.
   c. Remove and reinstall the CMM.
   d. Replace the CMM.
6. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any service bulletins that are related to network connectivity.
7. Remove the management node and make sure that the connectors on the chassis midplane and the management node are not damaged.
8. (Trained service technician only) Complete the following steps:
   a. Force the link/duplex speed.
   b. Check the connectors on the nodes and the chassis midplane to make sure that no pins are bent.
   c. Replace the I/O expansion card in the management node.
   d. Replace the system-board assembly in the management node.
   e. Replace the management node.

Multiple nodes cannot ping the management node in a different chassis

Use the information in this section to troubleshoot multiple nodes that cannot ping the Flex System Manager management node in a different chassis on the management network.

**Action**

Complete the following steps until the problem is solved:

1. Make sure that the management node is powered on and is not hung, by logging in to the management node. If you are unable to log in from the management network, attempt to log in from the data network.
If the management node is powered on and hung, perform a virtual reseat of the management node from the CMM.

2. Make sure that the CMM is powered on and is not hung by pinging the CMM from the management node:
   a. If the CMM is powered on and hung, reset the CMM.
   b. Make sure that the IMM, the management node, and the CMM are all on the same subnet.

3. Make sure that all cables between the CMMs and the top-of-rack switch are correctly connected and secure and that the activity LEDs are lit on the applicable ports.

4. Make sure that the CMMs (the CMM in the same chassis as the management node and the CMM in the remote chassis) have the same subnet address and can ping one another. If they cannot, make sure that the ports on the top-of-rack switch are enabled. Attempt to connect the CMMs directly if possible.

5. Make sure that the management node has fully discovered the nodes within its chassis by viewing the chassis map. If it has not fully discovered the nodes, follow the steps in “Multiple nodes cannot ping the management node in the same chassis” on page 812.

6. Make sure that the management processor for each compute node has a valid IP address by checking the chassis map of the remote chassis.

   **Note:** If the CMM recently lost connection to the DCHP server, you must reset the IMM by using the CMM interface so that a new IP address can be acquired.

   If a system-management processor does not have a valid IP address, complete the following steps:
   a. Restart the CMM in the remote chassis.
   b. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any firmware or software updates that might apply to this issue. You can view the release notes for a firmware update to determine the issues that are addressed by the update.
   c. Remove and reinstall the CMM.
   d. Replace the CMM.

7. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any service bulletins that are related to network connectivity.

8. Remove the node and make sure that the connectors on the chassis midplane and the node are not damaged.

9. (Trained service technician only) Complete the following steps:
   a. Force the link/duplex speed.
   b. Check the connectors on the nodes and the chassis midplane to make sure that no pins are bent.
   c. Replace the I/O expansion card in the management node.
   d. Replace the system-board assembly in the management node.

**Multiple nodes cannot ping the management node in the same chassis or a different chassis**

Use the information in this section to troubleshoot multiple nodes that cannot ping the Flex System Manager management node in the same chassis or a different chassis on the management network.

**Action**

Complete the following steps until the problem is solved:

1. Follow the steps in “Multiple nodes cannot ping the management node in the same chassis” on page 812.

2. Follow the steps in “Multiple nodes cannot ping the management node in a different chassis” on page 812.
Hard disk drive problems

Use this information to resolve hard disk drive problems.

Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
- See Chapter 5 “Parts listing, Types 7167 and 2590” on page 51 to determine which components are customer replaceable units (CRU) and which components are field replaceable units (FRU) that must be replaced only by a trained service technician.
- If an action step is preceded by “(Trained service technician only),” that step must be performed only by a trained service technician.

| Single compute node cannot connect intermittently                       | 1. Make sure that the network cables are correctly connected in the switch module ports and the switch module is correctly seated.  
2. Update the NIC device driver or the storage device controller device driver.  
3. See the documentation for the I/O module for resolving connectivity issues. |
| Two or more compute nodes cannot connect intermittently                 | 1. Using the diagnostic tools that are provided by the device manufacturer, test the I/O module that the devices are connected to.  
2. Attempt to connect one compute node to the network first, and connect other compute nodes, one by one, to try to isolate the problem.  
3. Update the I/O module firmware, if necessary.                        |
| Note: Restarting the compute node and running POST diagnostics on the I/O module might also help isolate the problem; however, this might have other ramifications to the network. |
| Compute nodes are not discovered by the Flex System Manager management node or the CMM intermittently | 1. Make sure that the compute node is recognized by the Flex System Manager management node or the CMM. If it might appear as an unknown device in the chassis map. If it is not recognized, complete the following steps.  
   a. Remove the compute node and inspect both the compute node and the back of the compute node bay to ensure that there is no physical damage to connectors.  
   b. Move the compute node to another node bay.  
   c. Replace the compute node.  
2. Make sure that the Flex System Manager management node or the CMM can ping the compute nodes. If they cannot, see “Cannot ping the Flex System Manager management node on the management network” on page 810.  
3. If the compute nodes are in another chassis, make sure that you have the proper software entitlements to manage that chassis with the Flex System Manager management node.  
4. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any firmware updates that might apply to this issue. You can view the release notes for a firmware update to determine the issues that are addressed by the update.  
5. Check [http://www.lenovo.com/support](http://www.lenovo.com/support) for any service bulletins that are related to network connectivity. |

**Memory problems**

Use this information to solve memory problems.

Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.

See Chapter 5 “Parts listing, Types 7167 and 2590” on page 51 to determine which components are customer replaceable units (CRU) and which components are field replaceable units (FRU) that must be replaced only by a trained service technician.

If an action step is preceded by “(Trained service technician only),” that step must be performed only by a trained service technician.

| The amount of system memory that is displayed is less than the amount of installed physical memory. | 1. Make sure that:  
   a. You have installed the correct type of memory (see “Installing a DIMM” on page 840).  
   b. Memory mirroring or memory sparing mode does not account for the discrepancy. You can check the memory configuration in the Setup utility (see “Using the Setup utility” on page 26).  
  2. If new memory has recently been installed, make sure that no configuration events are reported in the event log. If there are any events, resolve them.  
  3. If the compute node was recently installed, moved, or serviced, make sure that the DIMMs are correctly seated in the connectors (see “Installing a DIMM” on page 840).  
  4. Make sure that all DIMMs are enabled. The compute node might have automatically disabled a DIMM when it detected a problem, or a DIMM might have been manually disabled (see “Using the Setup utility” on page 26).  
  5. Run memory diagnostics (see “Lenovo Dynamic System Analysis Preboot diagnostic program” on page 65).  
  6. Remove DIMMs until the compute node is showing the correct amount of memory. Install one DIMM at a time until you can determine the DIMM that is not working properly. Remove that DIMM and replace it with a good DIMM (see “Removing a DIMM” on page 839, and “Installing a DIMM” on page 840).  
   **Note:** After you install or remove a DIMM, you must change and save the new configuration information by using the Setup utility. When you turn on the compute node, a message indicates that the memory configuration has changed. Start the Setup utility and select **Save Settings** (see “Using the Setup utility” on page 26 for more information) to save changes.  
  7. Contact Support. |

**Observable problems**

Use this information to solve observable problems.

Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.

| Compute node is unresponsive (POST is complete and operating system is running) | If you are in the same location as the compute node, complete the following steps:  
1. If you are using a KVM connection, make sure that the connection is operating correctly. Otherwise, make sure that the keyboard and mouse are operating correctly.  
2. If possible, log in to the compute node and verify that all applications are running (no applications are hung).  
3. Restart the compute node.  
4. Make sure that any new software has been installed and configured correctly.  
5. Contact your place of purchase of the software or your software provider.  
   If you are accessing the compute node from a remote location, complete the following steps:  
1. Make sure that all applications are running (no applications are hung).  
2. Attempt to log out of the system and log back in.  
3. Validate the network access by pinging or running a trace route to the compute node from a command line:  
   a. If you are unable to get a response during a ping test, attempt to ping another compute node in the chassis to determine whether it is a connection problem or compute node problem.  
   b. Run a trace route to determine where the connection breaks down. Attempt to resolve a connection issue with either the VPN or the point at which the connection breaks down.  
4. Restart the compute node remotely through the management interface.  
5. If the problem remains, verify that any new software has been installed and configured correctly.  
6. Contact your place of purchase of the software or your software provider. |
| Unusual smell | An unusual smell might be coming from newly installed equipment. If the problem remains, contact Support. |

</tr>
</tbody>
</table>

**Single node does not power on**

Complete the following steps until the problem is solved.

1. If you recently installed, moved, or serviced the computer node, reseat the compute node in the bay. If the compute node was not recently installed, moved, or serviced, perform a virtual reseat through the **CMM service** command. For more information about the CMM **service** command, see the.
2. Check the event logs for any events that are related to the compute node, and solve them. If a management node is available, check the event log on the management node. Otherwise, check the event log on the Chassis Management Module.

3. Make sure that the CMM can recognize the compute node. Log in to the CMM user interface and verify that the compute node appears in the chassis view. If the CMM cannot recognize the compute node, remove the compute node and inspect the compute node and the back of the node bay to make sure there is no physical damage to the connectors.

4. Make sure that the power policy that is implemented on the CMM is sufficient to enable the compute node to power on. You can view the power policy from the CMM `pmpolicy` command and the CMM web interface.

   • For more information about the CMM `pmpolicy` command, see the .
   • From the CMM web interface, select **Power Modules and Management** from the Chassis Management menu. For more information, see the . All fields and options are described in the CMM web interface online help.

5. Make sure that the management node has completed the discovery of the compute node. Log in to the management node user interface and verify that the compute node appears in the list of manageable systems.

6. Replace the base assembly (see “Removing and replacing the base assembly” on page 863).

   **Note:** Until you are able to replace the system-board assembly, you can attempt to power on the compute node from the CMM or from the management node user interface.

For additional information, see [UEFI Compliant Firmware on System x® and BladeCenter® Servers](/en/ss) and the Flex System Quick start guides.

### Multiple nodes do not power on

Complete the following steps until the problem is solved.

1. If you recently installed, moved, or serviced the computer nodes, reseat the compute nodes in the bays. If the compute nodes were not recently installed, moved, or serviced, perform a virtual reseat through the CMM `service` command. For more information about the CMM `service` command, see the .

2. Check the event logs for any events that are related to the compute nodes, and solve them. If a management node is available, check the event log on the management node. Otherwise, check the event log on the Chassis Management Module.

### Compute node does not power off

Complete the following steps until the problem is solved.

1. Attempt to power off the compute node through the management node user interface, if a management node is available. Otherwise, attempt to power off the compute node through the CMM user interface.

2. Attempt to restart the system-management processor for the compute node. You can restart the system-management processor through the CMM user interface. Click the compute node in the chassis view and then click **Restart System Mgmt Processor**. After the system-management processor has been restarted, attempt to power off the compute node from the CMM.

3. Attempt to power off the compute node by using the power button on the front of the node.

4. Attempt to reset the compute node from the CMM command-line interface (CLI) by using the `reset` command.

5. Reseat the CMM; then, perform steps 1-5 again.
Software problems
Use this information to solve software problems.

Complete the following steps until the problem is solved:

1. To determine whether the problem is caused by the software, make sure that:
   • The compute node has the minimum memory that is needed to use the software. For memory requirements, see the information that comes with the software.
     
     **Note:** If you have just installed an adapter or memory, the compute node might have a memory-address conflict.
   • The software is designed to operate on the compute node.
   • Other software works on the compute node.
   • The software works on another compute node.

2. If you receive any error messages while you use the software, see the information that comes with the software for a description of the messages and suggested solutions to the problem.

3. Contact your place of purchase of the software.

Solving undetermined problems
Use this information to solve undetermined problems.

**Notes:** When you are diagnosing a problem in the compute node, you must determine whether the problem is in the compute node or in the Flex System chassis.

- If all of the compute nodes have the same symptom, the problem is probably in the Flex System chassis. For more information, see the documentation for your Flex System chassis.
- If the Flex System chassis contains more than one compute node and only one of the compute nodes has the problem, troubleshoot the compute node that has the problem.

If DSA did not diagnose the failure or if the compute node is inoperative, use the information in this section.

If you suspect that a software problem is causing failures (continuous or intermittent), see “Software problems” on page 824.

Corrupted data in CMOS memory or corrupted UEFI code can cause undetermined problems. To reset the CMOS data, remove and replace the CMOS battery to override the power-on password and clear the CMOS memory; see “Removing the CMOS battery” on page 834. If you suspect that the UEFI code is corrupted, see “Recovering a UEFI image” on page 24.

Check the LEDs on all the power supplies of the Flex System chassis in which the compute node is installed. If the LEDs indicate that the power supplies are working correctly and reseating the compute node does not correct the problem, complete the following steps:

1. If no LEDs on the control panel are working, try to turn on the compute node from the Chassis Management Module (see the documentation for the Flex System chassis and Chassis Management Module for more information).

2. Turn off the compute node.

3. Remove the compute node from the Flex System chassis and remove the cover.

4. Remove or disconnect the following devices, one at a time, until you find the failure. Reinstall, turn on, and reconfigure the compute node each time.
   • I/O expansion adapter.
   • Hard disk drives.
   • DIMMs. The minimum configuration requirement is 4 GB (one 4 GB DIMM on the system board). The following minimum configuration is required for the compute node to start:
- Base assembly
- One microprocessor
- One 4 GB DIMM
- A functioning Flex System chassis

5. Install and turn on the compute node. If the problem remains, suspect the following components in the following order:
   a. DIMM
   b. Base assembly
   c. Microprocessor

If the problem is solved when you remove an I/O expansion adapter from the compute node but the problem recurs when you reinstall the same adapter, suspect the I/O expansion adapter; if the problem recurs when you replace the adapter with a different one, suspect the system-board assembly.

If you suspect a networking problem and the compute node passes all the system tests, suspect a network cabling problem that is external to the system.

**Collecting service data**

The first-failure data capture (FFDA) tool monitors, tracks, and captures system hardware errors and hardware and software inventory information, and reports serviceable problems directly to Support. You can also choose to collect data manually. This tool is integrated into the IMM2. All information sent is encrypted and stored in a secure database and used for improved problem determination.

For more information about accessing the IMM2, see Chapter 4 “Accessing the IMM2” on page 43.
Chapter 7. Installing, removing, and replacing compute node components

Use this information to install, remove, and replace FRUs and optional devices in the compute node.

See Chapter 5 “Parts listing, Types 7167 and 2590” on page 51 to determine whether a component is a consumable part, Tier 1 CRU, or Tier 2 CRU.

For information about the terms of the warranty and getting service and assistance, see the Warranty Information document.

Installing an optional device

Some compute node components are available as both an optional device and a replaceable component. The installation procedure is the same for the optional device and the replaceable component.

Installation guidelines

Before you remove or replace a FRU or install an optional device, read the following information:

- Before you begin, read “Safety” on page iii and “Handling static-sensitive devices” on page 828. This information will help you work safely.
- When you install your new compute node, take the opportunity to download and apply the most recent firmware updates. This step will help to ensure that any known issues are addressed and that your compute node is ready to function at maximum levels of performance. To download the latest firmware and device drivers, go to http://www.ibm.com/support/fixcentral and select PureSystems, PureFlex System, Compute Node and x440 Compute Node.
- Observe good housekeeping in the area where you are working. Place removed covers and other parts in a safe place.
- Back up all important data before you make changes to hard disk drives.
- Before you remove a compute node from the Flex System chassis, you must shut down the operating system and turn off the compute node. You do not have to shut down the chassis itself.
- Blue on a component indicates touch points, where you can grip the component to remove it from or install it in the compute node, open or close a latch, and so on.
- For a list of supported optional devices for the compute node, see http://www.lenovo.com/serverproven/

System reliability guidelines

Use these guidelines to ensure that the compute node meets the cooling and system reliability requirements:

- To ensure proper cooling, the Flex System chassis is not operated without a compute node or node bay filler in each node bay. See for additional information.
- A socket cover and heat-sink filler or a microprocessor and heat sink must always be installed on microprocessor sockets 1, 3, and 4. Microprocessor socket 2 will only have a socket cover when a microprocessor is not install. If the compute node has only one microprocessor, it must be installed in microprocessor socket 1.
- The air baffles are installed over the DIMM connectors.
- The ventilation holes on the compute node are not blocked.
Handling static-sensitive devices

To reduce the possibility of damage from electrostatic discharge, observe these precautions.

Attention: Static electricity can damage the compute node and other electronic devices. To avoid damage, keep static-sensitive devices in their static-protective packages until you are ready to install them.

- When you work on a Flex System chassis that has an electrostatic discharge (ESD) connector, use a wrist strap, especially when you handle modules, optional devices, or compute nodes. To work correctly, the wrist strap must have a good contact at both ends (touching your skin at one end and firmly connected to the ESD connector on the front or back of the Flex System chassis).
- Limit your movement. Movement can cause static electricity to build up around you.
- Handle the device carefully, holding it by its edges or its frame.
- Do not touch solder joints, pins, or exposed circuitry.
- Do not leave the device where others can handle and damage it.
- While the device is still in its static-protective package, touch it to an unpainted metal part of the Flex System chassis or any unpainted metal surface on any other grounded rack component in the rack in which you are installing the device for at least 2 seconds. This drains static electricity from the package and from your body.
- Remove the device from its package and install it directly into the compute node without setting down the device. If it is necessary to set down the device, put it back into its static-protective package. Do not place the device on the compute node cover or on a metal surface.
- Take additional care when you handle devices during cold weather. Heating reduces indoor humidity and increases static electricity.

Returning a device or component

If you are instructed to return a device or component, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Updating the compute node configuration

Use this information to update the compute node configuration.

When the compute node starts for the first time after you add or remove an internal device, you might receive a message that the configuration has changed. The Setup utility automatically starts so that you can save the new configuration settings. See “Using the Setup utility” on page 26 for more information about the Setup utility.

Some devices have device drivers that you must install. See the documentation that comes with each device for information about installing device drivers.

The compute node operates as a symmetric multiprocessing (SMP) compute node, regardless of how many microprocessors are installed. For optimum performance, you must upgrade the operating system to support SMP. See Chapter 3 “Installing the operating system” on page 39 and your operating-system documentation for additional information.

Removing a compute node from a chassis

Use this information to remove a compute node from a Flex System chassis.

Before you remove a compute node, complete the following steps:
- Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is operating, shut down the operating system.
3. Press the power button to turn off the compute node (see “Turning off the compute node” on page 17 for more information).

To remove the compute node from a chassis, complete the following steps:
Step 1. Open the front handles as shown in the illustration. The compute node moves out of the node bay approximately 0.6 cm (0.25 inch).

**Attention:**
- To maintain proper system cooling, do not operate the Flex System chassis without a compute node or node bay filler installed in each node bay.
- When you remove the compute node, note the node bay number. Reinstalling a compute node into a different node bay from the one it was removed from can have unintended consequences. Some configuration information and update options are established according to node bay number. If you reinstall the compute node into a different node bay, you might have to reconfigure the compute node.

Step 2. Pull the compute node out of the node bay.
Step 3. Install either a node bay filler or another compute node in the node bay within 1 minute.

If you are instructed to return the compute node, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

### Installing a compute node in a chassis

Use this information to install a compute node in a Flex System chassis.

- Before you install a x440 Compute Node Types 7167 and 2590 in a chassis that is managed by Flex System Manager management software, make sure that the management software is version 1.1.1.0 or later. To determine whether your management software must be updated, and for more information about downloading and installing an update, see the "Updating systems" section of the.
- Before you install a x440 Compute Node Types 7167 and 2590 in a chassis, make sure the Chassis Management Module firmware release date is 08/20/2012 or later. To determine whether your CMM firmware must be updated, log on to the Chassis Management Module web interface. Click on the
Chassis Management Module in the graphical user interface; then, select Firmware. To update the CMM firmware to the latest release, see http://www.ibm.com/support/fixcentral. Select PureSystems, PureFlex System, Chassis, Enterprise Chassis, Your operating system and Continue.

- If you are installing a compute node model that does not have an integrated Ethernet controller, you must install a network interface adapter before you install the compute node in the chassis for management network communication. For a list of supported optional devices for the compute node, see http://www.lenovo.com/serverproven/.

Before you install the compute node in a chassis, read “Safety” on page iii and “Installation guidelines” on page 827.

Statement 21

CAUTION:
Hazardous energy is present when the compute node is connected to the power source. Always replace the compute node cover before installing the compute node.

To install the compute node in a chassis, complete the following steps.

Step 1. Select the node bay.

Notes:
1. If you are reinstalling a compute node that you removed, you must install it in the same node bay from which you removed it. Some compute node configuration information and update options are established according to node bay number. Reinstalling a compute node into a different node bay can have unintended consequences. If you reinstall the compute node into a different node bay, you might have to reconfigure the compute node.
2. To maintain proper system cooling, do not operate the Flex System chassis without a compute node or node bay filler in each node bay.

Step 2. Make sure that the front handles on the compute node are in the open position.

Step 3. Slide the compute node into the node bay until it stops.
Step 4. Push the front handles on the front of the compute node to the closed position.

**Note:** After the compute node is installed, the IMM2 in the compute node initializes and synchronizes with the Chassis Management Module. This process takes approximately 90 seconds to complete. The power LED flashes rapidly, and the power button on the compute node does not respond until this process is complete.

Step 5. Turn on the compute node (see “Turning on the compute node” on page 16 for instructions).

Step 6. Make sure that the power LED on the compute node control panel is lit continuously, indicating that the compute node is receiving power and is turned on.

Step 7. If you have other compute nodes to install, do so now.

Step 8. You can place identifying information on the label tabs that are accessible from the front of the compute node.

If this is the initial installation of the compute node in the chassis, you must configure the compute node through the Setup utility and install the compute node operating system. See page 26 for details.

If you have changed the configuration of the compute node or if you are installing a different compute node from the one that you removed, you must configure the compute node through the Setup utility, and you might have to install the compute node operating system (see “Using the Setup utility” on page 26).

---

**Removing and replacing Tier 1 customer replaceable units (CRUs)**

Use this information for removing and replacing Tier 1 CRUs.

Replacement of Tier 1 CRUs is your responsibility. If Lenovo installs a Tier 1 CRU at your request, you will be charged for the installation.

**Removing the adapter-retention assembly**

Use this information to remove the adapter-retention assembly.

Before you remove the adapter-retention assembly, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

The adapter-retention assembly consists of five separate parts. You can replace only the parts that you choose and save the unused parts for future use.

To remove the adapter-retention assembly, complete the following steps.
Adapter retention assemblies

Step 1. Remove the cover (see “Removing the compute node cover” on page 836).
Step 2. Remove the air baffles.
Step 3. If necessary, remove the I/O expansion adapters (see “Removing an I/O expansion adapter” on page 857).
Step 4. Carefully place the chassis on its side with the front handle side up.
Step 5. Using a T9 Torx screwdriver, remove the three screws that secure the adapter-retention assembly.
Step 6. Lift the adapter-retention assembly from the system board.
Step 7. Carefully return the chassis to the bottom-side-down orientation.

If you are instructed to return the adapter-retention assembly, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

**Installing the adapter-retention assembly**

Use this information to install the adapter-retention assembly.

Before you install the adapter-retention assembly, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

The adapter-retention assembly consists of five separate parts. You can replace only the parts that you choose and save the unused parts for future use.

To install the adapter-retention assembly, complete the following steps.
Step 1. Remove the cover (see “Removing the compute node cover” on page 836).
Step 2. Remove the air baffles.
Step 3. Carefully place the chassis on its side with the front handle side up.
Step 4. Align the adapter-retention assembly on the system board.
Step 5. Using a T9 Torx screwdriver, install the screws that secure the adapter-retention assembly.
Step 6. Carefully return the chassis to the bottom-side-down orientation.
Step 7. Install the I/O expansion adapters, if you removed them (see “Installing an I/O expansion adapter” on page 858).
Step 8. Install the air baffles.

Attention: Install the air baffles with the arrow indicating airflow direction pointing to the rear of the compute node.

After you install the adapter-retention assembly, complete the following steps:
1. Install the cover onto the compute node (see “Installing the compute node cover” on page 838 for instructions).
2. Install the compute node into the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).

Removing the bezel

Use this information to remove the bezel.

Before you remove the bezel, read “Safety” on page iii and “Installation guidelines” on page 827.

To remove the bezel, complete the following steps.
Step 1. Use a flat-blade screwdriver to carefully pull the bezel from the compute node.
Step 2. Lift the bezel from the compute node.

If you are instructed to return the bezel, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing the bezel

Use this information to install the bezel.

Before you install the bezel, read “Safety” on page iii and “Installation guidelines” on page 827.

To install the bezel, complete the following steps.

Step 1. Position the bezel on the front of the compute node.
Step 2. Press the bezel securely against the chassis.

**Note:** Make sure that the bezel is pressed flat against the chassis around the power button, to maintain access to the power button.

Removing the CMOS battery

Use this information to remove the CMOS battery.
Before you remove the CMOS battery, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

To remove the CMOS battery, complete the following steps:

Step 1. Remove the cover (see “Removing the compute node cover” on page 836).
Step 2. Locate the CMOS battery on the system board (see “System-board connectors” on page 18).
Step 3. If a cover is over the CMOS battery, remove the cover.
Step 4. Pivot the CMOS battery toward the middle of the compute node.
Step 5. Lift the CMOS battery from the socket.

After you remove the CMOS battery, dispose of the CMOS battery as required by local ordinances or regulations.

Installing the CMOS battery

Use this information to install a CMOS battery.

Before you install the CMOS battery, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

The following notes describe information that you must consider when you are replacing the CMOS battery in the compute node:

- You must replace the CMOS battery with a lithium CMOS battery of the same type.
- To order replacement batteries, call 1-800-426-7378 within the United States, and 1-800-465-7999 or 1-800-465-6666 within Canada. Outside the U.S. and Canada, call your marketing representative or authorized reseller.
- After you replace the CMOS battery, you must reconfigure the compute node and reset the system date and time.
- To avoid possible danger, read and follow the following safety statement.

**Statement 2**
CAUTION:
When replacing the lithium battery, use only Part Number 33F8354 or an equivalent type battery recommended by the manufacturer. If your system has a module containing a lithium battery, replace it only with the same module type made by the same manufacturer. The battery contains lithium and can explode if not properly used, handled, or disposed of. Do not:

- Throw or immerse into water
- Heat to more than 100° C (212° F)
- Repair or disassemble

Dispose of the battery as required by local ordinances or regulations.

Attention: Touching the CMOS battery on a metal surface, such as the side of the compute node, when you replace the CMOS battery can cause it to fail.

To install a CMOS battery, complete the following steps:

Step 1. Remove the cover (see “Removing the compute node cover” on page 836).
Step 2. Follow any special handling and installation instructions that come with the CMOS battery.
Step 3. Locate the CMOS battery socket on the system board (see “System-board connectors” on page 18).
Step 4. Orient the CMOS battery so that the positive (+) side faces in toward the center of the compute node.
Step 5. Pivot the CMOS battery so that you can insert it into the bottom of the socket.
Step 6. As you slide the CMOS battery into place, press the top of the CMOS battery into the socket.
Step 7. If you removed a cover from the battery, replace the cover.

After you install the CMOS battery, complete the following steps:

1. Install the cover onto the compute node (see “Installing the compute node cover” on page 838 for instructions).
2. Install the compute node into the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).
3. Turn on the compute node, start the Setup utility, and reset the configuration (see “Using the Setup utility” on page 26 for instructions).

Removing the compute node cover

Use this information to remove the cover from a compute node.

Before you remove the compute node cover, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

Statement 12

![CAUTION:]
The following label indicates a hot surface nearby.

Statement 21

![CAUTION:]
Hazardous energy is present when the compute node is connected to the power source. Always replace the compute node cover before installing the compute node.

To remove the compute node cover, complete the following steps:

Step 1. Press on the release button and the push point at the same time and slide the cover toward the rear of the compute node.

Step 2. Lift the cover away from the compute node.

Step 3. Lay the cover flat or store it for future use.
If you are instructed to return the cover, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

**Installing the compute node cover**

Use this information to install the compute node cover.

Before you install the compute node cover, read “Safety” on page iii and “Installation guidelines” on page 827.

**Attention:** You cannot insert the compute node into the Flex System chassis until the cover is installed and closed. Do not attempt to override this protection.

**Statement 21**

**CAUTION:**
**Hazardous energy is present when the compute node is connected to the power source. Always replace the compute node cover before installing the compute node.**

To install the compute node cover, complete the following steps:

**Step 1.** Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

**Step 2.** Orient the cover so that the posts on the inside of the cover slide into the slots on the compute node.

**Note:** Before you close the cover, make sure that the air baffles and all components are installed and seated correctly and that you have not left loose tools or parts inside the compute node.

**Step 3.** Hold the front of the compute node and slide the cover forward to the closed position, until it clicks into place.
After you install the compute node cover, install the compute node into the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).

**Removing a DIMM**

Use this information to remove a dual inline memory module (DIMM).

Before you remove a DIMM, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

After you install or remove a DIMM, you must change and save the new configuration information by using the Setup utility. When you turn on the compute node, a message indicates that the memory configuration has changed. Start the Setup utility and select **Save Settings** (see “Using the Setup utility” on page 26 for more information) to save changes.

To remove a DIMM, complete the following steps.

Step 1. Remove the cover (see “Removing the compute node cover” on page 836).

Step 2. Remove the air baffle that is installed over the DIMM connector.
Step 3. Locate the DIMM connectors (see “System-board connectors” on page 18). Determine which DIMM you want to remove from the compute node.

Note: You might have to remove the I/O expansion adapter.

Attention: To avoid breaking the retaining clips or damaging the DIMM connectors, handle the clips gently.

Step 4. Make sure that both retaining clips on the DIMM connector from which you are removing the DIMM are in the open position.

Note: You might have to remove the I/O expansion adapter.

Step 5. Pull the DIMM out of the connector.

Step 6. If you are not immediately replacing the DIMM, install the air baffle.

Attention:
- Install the air baffles with the arrow indicating air flow direction pointing to the rear of the compute node.
- To maintain proper system cooling, do not operate the compute node without air baffles installed over the DIMM connectors.

If you are instructed to return the DIMM, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing a DIMM

Use this information to install a DIMM.

Before you install a DIMM, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. Read the documentation that comes with the DIMMs.
3. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
4. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.
This component can be installed as an optional device or as a CRU. The installation procedure is the same for the optional device and the CRU.

After you install or remove a DIMM, you must change and save the new configuration information by using the Setup utility. When you turn on the compute node, a message indicates that the memory configuration has changed. Start the Setup utility and select **Save Settings** (see “Using the Setup utility” on page 26 for more information) to save changes.

If you are installing a DIMM as a result of a DIMM failure, you might have to reenable the DIMM. To re-enable the DIMM, complete the following steps:

1. Verify that the amount of installed memory is the expected amount of memory through the operating system, by watching the monitor as the compute node starts, by using the CMM `sol` command, or through the management node (if available).
   - For more information about the CMM `sol` command, see the document.
   - For more information about Flex System Manager management software, see document.
2. Run the Setup utility to reenable the DIMMs (see “Using the Setup utility” on page 26 for more information).

The compute node has a total of 48 dual inline memory module (DIMM) connectors. The compute node supports low-profile (LP) DDR3 DIMMs with error-correcting code (ECC) in 4 GB, 8 GB, 16 GB and 32 GB capacities.

The following illustration shows the system-board components, including the DIMM connectors.
The memory is accessed internally through 16 channels (four channels for each microprocessor). Each channel contains three DIMM connectors. Each channel can have a maximum of eight ranks. The following table lists each channel and shows which DIMM connectors are in the channel.

Table 12. Memory-channel configuration

The following notes describe information that you must consider when you install memory:

- You cannot mix RDIMMs, LRDIMMs and UDIMMs in the same compute node.
- UDIMMs are not supported at three DIMMs per channel.
- A total of eight ranks on each channel is supported.
- If a quad-rank DIMM is installed, install it in the connector at the end of the memory channel.
- If a channel has one or more quad-rank RDIMMs, only two DIMMs per channel is supported. The quad-rank, eight rank per channel limitation only applies to RDIMMs. Quad-rank LRDIMMs can be installed at three DIMMs per channel since the processor recognizes LRDIMMs as dual-rank DIMMs.

There are three memory modes:

- **Independent-channel mode:** Independent-channel mode provides a maximum of 384 GB of usable memory per processor and 1536 GB of usable memory with all four processors installed using 32 GB DIMMs. DIMMs must be first installed in the last physical DIMM connector of each channel. DIMMs should also be installed one DIMM per channel first. The best performance is seen with an even memory distribution among all four channels on the microprocessor. DIMMs can be installed without matching sizes. Individual channels may run at different DIMM timings, but all channels must run at the same interface frequency. DIMMs with different timing parameters can be installed in different connectors of the same channel, but only timings that support the slowest DIMM are applied to all the DIMMs. Faster DIMMs operate at timings that are supported by the slowest installed DIMM.

- **Mirrored-channel mode:** In mirrored-channel mode, memory is installed in pairs. Both DIMMs in a pair must be identical in capacity, type, and rank count. The channels are grouped in pairs with each channel receiving the same data. One channel is used as a backup of the other, which provides redundancy. In mirrored-channel mode, memory must be installed in pairs. The memory content is mirrored between channel 0 and channel 1 and between channel 2 and channel 3. Mirrored-channel mode requires that channel 0 and channel 1, and channel 2 and channel 3 are be populated identically in regard to size and organization. DIMM connector populations within a channel do not have to be identical, but the same DIMM connector location across channel 0 and channel 1 and across channel 2 and channel 3 must be populated in the same way. The effective memory that is available to the system is only half of what is installed.

- **Rank-sparing mode:** In rank-sparing mode, one memory DIMM rank serves as a spare of the other ranks on the same channel. The spare rank is held in reserve and is not used as active memory. The spare rank must have identical or larger memory capacity than all the other active DIMM ranks on the same channel. After an error threshold is surpassed, the contents of that rank are copied to the spare rank. The failed rank of DIMMs is taken offline, and the spare rank is put online and used as active memory in place of the failed rank. The following notes describe additional information that you must consider when you select rank-sparing memory mode:
  - Memory sparing on one channel is independent of the sparing on all other channels.
  - You can use the Setup utility to determine the status of the DIMM ranks.
If only one DIMM is present in a channel and the DIMM is dual or single rank, then sparing mode should not be enabled.

Rank-sparing on one channel is independent of the sparing on all other channels. You can use the Setup utility to determine the status of the DIMM ranks.

Install DIMMs in the order that is indicated in the following table for independent-channel mode.

</tbody>
</table>

1. For mirrored-channel mode, the DIMM pair must be identical in size, type, and rank count.

To install a DIMM, complete the following steps:

Step 1. Remove the cover (see “Removing the compute node cover” on page 836).
Step 2. Read the documentation that comes with the DIMM.
Step 3. Remove the air baffle installed over the DIMM connector.

Step 4. Locate the DIMM connectors (see “System-board connectors” on page 18). Determine which DIMM connector you want to install the DIMM in.
Step 5. Touch the static-protective package that contains the DIMM to any unpainted metal surface on the Flex System chassis or any unpainted metal surface on any other grounded rack component in the rack in which you are installing the DIMM for at least 2 seconds; then, remove the DIMM from its package.
Step 6. Make sure that both retaining clips on the DIMM connector are in the open position.

Step 7. Turn the DIMM so that the DIMM keys align correctly with the DIMM connector on the system board.

Attention: To avoid breaking the retaining clips or damaging the DIMM connector, handle the clips gently.

Step 8. Press the DIMM into the DIMM connector. The retaining clips lock the DIMM into the connector.

Step 9. Make sure that the small tabs on the retaining clips engage the notches on the DIMM. If there is a gap between the DIMM and the retaining clips, the DIMM has not been correctly installed. Press the DIMM firmly into the connector, and then press the retaining clips toward the DIMM until the tabs are fully seated. When the DIMM is correctly installed, the retaining clips are parallel to the sides of the DIMM.

Step 10. Install the air baffle over the DIMM connector.

Attention:
- Install the air baffles with the arrow indicating air flow direction pointing to the rear of the compute node.
- To maintain proper system cooling, do not operate the compute node without air baffles installed over the DIMM connectors.

After you install the DIMM, complete the following steps:
1. Install the cover onto the compute node (see “Installing the compute node cover” on page 838 for instructions).

2. Install the compute node into the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).

Removing the front handle

Use this information to remove the front handle.

Before you remove the front handles, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.

2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).

3. Carefully lay the compute node on a flat, static-protective surface with the cover side down, orienting the compute node with the bezel pointing toward you.

To remove the front handles, complete the following steps.

Step 1. Locate the screws that attach the handles to the compute node.

Step 2. Using a T8 Torx screwdriver, remove the screw from each front handle and save the screw in a safe place. Use the same screws when you install the front handles.

If you are instructed to return the front handles, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing the front handles

Use this information to install the front handle.
Before you install the front handles, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface with the cover side down, orienting the compute node with the bezel pointing toward you.

To install the front handles, complete the following steps.

Step 1. Orient the front handles so that the blue release latches are toward the middle of the compute node.

Step 2. Align the hole in the handles with the holes on the compute node where the handles are installed.

Step 3. Using a T8 Torx screwdriver, install the screw that secures each handle. Use the screws that you removed when you removed the handles.

After you install the front handles, install the compute node into the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).

**Removing the hard disk drive backplane**

Use this information to remove the hard disk drive backplane.

**Note:** This procedure should be performed only by trained service technicians.

Before you remove the hard disk drive backplane, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).

3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

To remove the hard disk drive backplane, complete the following steps.

Step 1. Remove the cover (see “Removing the compute node cover” on page 836).

Step 2. For the hard disk drive backplane that you have to replace, disconnect the applicable hard disk drive by pressing the release latch (orange) on the hard disk drive to release the drive handle; then, use the drive handle to slide the hard disk drive approximately 12 mm (0.5 in.) out of the bay. See “Removing a hot-swap hard disk drive” on page 856).

Step 3. To disconnect the cable from the hard disk drive backplane that you removed, pull the connector clip away from the cable to unhook the clip from the backplane as you push the cable connector toward the rear of the compute node 1.

Step 4. Push the retention clip on the hard disk drive cage toward the rear of the compute node to release it from under the tab; then, slide the retention clip toward the front of the compute node to release the hard disk drive backplane 2.

Step 5. Disconnect the hard disk drive backplane cable from the system board 3.

Step 6. Lift out the hard disk drive backplane and cable. It might be necessary to pull the backplane toward the front of the compute node before you lift it out of the compute node 4.

If you are instructed to return the hard disk drive backplane, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.
Installing the hard disk drive backplane

Use this information to install the hard disk drive backplane.

**Note:** This procedure should be performed only by trained service technicians.

Before you install the hard disk drive backplane, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

To install the hard disk drive backplane, complete the following steps.

**Step 1.** Remove the cover (see “Removing the compute node cover” on page 836).

**Step 2.** To connect the backplane cable to the new hard disk drive backplane, hold open the connector clip while you push the cable connector into the backplane cable connector. Make sure that the connector clip clicks into place around the backplane.

![Connector clip](image)

**Note:** Pull the retention clip forward when you install the backplane.

**Step 3.** Align the new hard disk drive backplane with the hard disk drive cage and the connector on the system board and press the backplane into position until it is fully seated in the connector.

![Hard disk drive backplane](image)

**Step 4.** Push the retention clip on the hard disk drive cage toward the rear of the compute node and under the tab to secure the backplane.

**Step 5.** Connect the hard disk drive backplane cable to the system board.

Chapter 7. Installing, removing, and replacing compute node components 855
Step 6. Connect the flex cable to the hard disk drive backplane connector.

Step 7. Reconnect the hard disk drive by sliding it fully into the bay and closing the drive tray handle, see “Installing a hot-swap hard disk drive” on page 856.

Step 8. Install the cover onto the compute node (see “Installing the compute node cover” on page 838 for instructions).

Step 9. Install the compute node into the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).

After you install the hard disk drive backplane, complete the following steps:

1. Install the cover onto the compute node (see “Installing the compute node cover” on page 838 for instructions).
2. Install the compute node into the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).

Removing a hot-swap hard disk drive

Use this information to remove a hot-swap hard disk drive.

Before you remove a hot-swap hard disk drive, complete the following steps:

1. Back up all important data before you make changes to hard disk drives.
2. Read “Safety” on page iii and “Installation guidelines” on page 827.

The compute node has two hard disk drive bays for installing or removing hot-swap hard disk devices. To remove a hot-swap hard disk drive, complete the following steps.

Step 1. Press the release latch (orange) on the hard disk drive to release the drive handle.
Step 2. Pull the release handle to remove the drive from the bay.

If you are instructed to return the hard disk drive, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing a hot-swap hard disk drive

Use this information to install a hot-swap hard disk drive.
Before you install the hot-swap hard disk drive, read “Safety” on page iii and “Installation guidelines” on page 827.

The compute node has two SAS or SATA hard disk drive bays for installing hot-swap hard disk drives, such as hot-swap SAS hard disk drives. One hard disk drive might already be installed in the compute node in hard disk drive bay 0. If the compute node is equipped with one hard disk drive, you can install an additional drive in hard disk drive bay 1. The compute node supports using RAID 0 or RAID 1 when two hard disk drives of the same interface type are installed. See “Configuring a RAID array” on page 35 for information about RAID configuration.

To install a hot-swap hard disk drive or hard disk drive bay filler, complete the following steps.

**Step 1.** Identify the hard disk drive bay (hard disk drive bay 0 or hard disk drive bay 1) in which you plan to install the hot-swap hard disk drive.

**Step 2.** If a hard disk drive bay filler is installed, remove it from the compute node by pulling the release lever and sliding the filler away from the compute node.

**Step 3.** Touch the static-protective package that contains the hot-swap hard disk drive to any unpainted metal surface on the Flex System chassis or any unpainted metal surface on any other grounded rack component; then, remove the hard disk drive from the package.

**Step 4.** Open the release lever on the hot-swap hard disk drive and slide the drive into the bay until it is firmly seated in the connector.

**Step 5.** Lock the hot-swap hard disk drive into place by closing the release lever.

**Step 6.** Check the hard disk drive status LEDs to make sure that the hard disk drive is operating correctly.

See “Configuring a RAID array” on page 35 for information about SAS RAID configuration.

### Removing an I/O expansion adapter

Use this information to remove an I/O expansion adapter.

Before you remove the I/O expansion adapter, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.

2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

To remove an I/O expansion adapter, complete the following steps.

![Diagram of adapter with steps labeled]

**Step 1.** Remove the cover (see “Removing the compute node cover” on page 836).

**Step 2.** Locate the I/O expansion adapter connectors (see “System-board layouts” on page 18).

**Step 3.** Open the retention clips 1.

**Step 4.** Lift the I/O expansion adapter from the connector and remove the I/O expansion adapter from the compute node 2. You might find it helpful to rock the adapter back and forth to disengage the adapter.

If you are instructed to return the I/O expansion adapter, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

**Installing an I/O expansion adapter**

Use this information to install an I/O expansion adapter.

Before you install an I/O expansion adapter, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.
4. If your adapter was previously configured, backup or record its configuration information, if possible, before replacing the adapter. See the documentation for your adapter for information and instructions.

This component can be installed as an optional device or as a CRU. The installation procedure is the same for the optional device and the CRU.

To install an I/O expansion adapter, complete the following steps.
Step 1. Remove the cover (see “Removing the compute node cover” on page 836).

Step 2. Locate the I/O expansion connectors (see “System-board connectors” on page 18).

Step 3. Remove the expansion cover from the connector, if one is present.

Step 4. Touch the static-protective package that contains the adapter to any unpainted metal surface on the Flex System chassis or any unpainted metal surface on any other grounded rack component; then, remove the adapter from the package.

Step 5. Open the retention clips if they are closed.

Step 6. Orient the connector on the expansion adapter with the I/O expansion connector and alignment pins on the system board; then, press the adapter into the I/O expansion connector.

Step 7. Firmly press on the indicated locations to seat the expansion adapter in the connector and over the alignment pins.

Step 8. Close the retention clips.

After you install the I/O expansion adapter, complete the following steps:

1. Install the cover onto the compute node (see “Installing the compute node cover” on page 838 for instructions).

2. Install the compute node into the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).

3. See the documentation that comes with the expansion adapter for device-driver and configuration information to complete the installation.

Removing the light path diagnostics panel

Use this information to remove the light path diagnostics panel.

Before you remove the light path diagnostics panel, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.

2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).

3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

To remove the light path diagnostics panel, complete the following steps.
Step 1. Remove the cover (see “Removing the compute node cover” on page 836).
Step 2. Pull the light path diagnostics panel out of the bracket.
Step 3. Disconnect the cable from the system board.
Step 4. Lift the light path diagnostics panel from the compute node.

If you are instructed to return the light path diagnostics panel, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing the light path diagnostics panel

Use this information to install the light path diagnostics panel.

Before you install the light path diagnostics panel, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

To install a light path diagnostics panel, complete the following steps.
Step 1. Remove the cover (see “Removing the compute node cover” on page 836).
Step 2. Connect the cable on the system board.
Step 3. Align the light path diagnostics panel with the bracket.
Step 4. Press the light path diagnostics panel securely into the bracket.

After you install the light path diagnostics panel, complete the following steps:
1. Install the cover onto the compute node (see “Installing the compute node cover” on page 838 for instructions).
2. Install the compute node into the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).

Removing the USB flash drive

Use this information to remove the USB flash drive.

Before you remove the USB flash drive, complete the following steps:
1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing away from you.

To remove the USB flash drive, complete the following steps.
Step 1. Remove the cover (see “Removing the compute node cover” on page 836).

Step 2. Locate the USB connectors on the system board.

   **Note:** You might have to remove an I/O expansion adapter to remove the USB flash drive. See “Removing an I/O expansion adapter” on page 857 for instructions.

Step 3. Pull the USB flash drive out of the connector.

If you are instructed to return the USB flash drive, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

### Installing the USB flash drive

Use this information to install the USB flash drive.

Before you install the USB flash drive, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.

2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).

3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

This component can be installed as an optional device or as a CRU. The installation procedure is the same for the optional device and the CRU.

To install the USB flash drive, complete the following steps.
Step 1. Remove the cover (see “Removing the compute node cover” on page 836).

Step 2. Locate the USB connectors on the system board.

   Note: You might have to remove an I/O expansion adapter install the USB flash drive. See “Removing an I/O expansion adapter” on page 857 for instructions.

Step 3. Push the USB flash drive into the connector.

After you install the USB flash drive, complete the following steps:
1. Install the cover onto the compute node (see “Installing the compute node cover” on page 838 for instructions).
2. Install the compute node into the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).

Removing and replacing Tier 2 customer replaceable units (CRUs)

Use this information for removing and replacing Tier 2 CRUs.

You may install a Tier 2 CRU yourself or request Lenovo to install it, at no additional charge, under the type of warranty service that is designated for the compute node. A Tier 2 CRU must be installed only by trained service technicians.

Removing and replacing the base assembly

Use this information to remove and replace the base assembly.

Notes:
- This procedure should be performed only by trained service technicians.
- If possible, back up all compute node settings, including the settings for any options installed in the compute node. You can backup and restore system settings using the Advanced Setup Utility (ASU) (see https://support.lenovo.com/us/en/documents/LNVO-ASU for information and instructions).

Before you replace the base assembly, complete the following steps:
1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the replacement base assembly (base assembly FRU) and the defective base assembly (defective node) side-by-side on a flat, static-protective surface.

4. Obtain the following for use during the replacement procedure (see Chapter 5 “Parts listing, Types 7167 and 2590” on page 51).
   - Alcohol wipes
   - Thermal grease

**Important:** When you replace the base assembly, you must update the compute node with the latest firmware or restore the preexisting firmware. Make sure that you have the latest firmware or a copy of the preexisting firmware before you proceed. See “Updating firmware and device drivers” on page 23 for more information.

See “System-board layouts” on page 18 for more information about the locations of the connectors, switches, and LEDs on the system board.

To remove and replace the base assembly, complete the following steps:

**Important:** To avoid damage when replacing a defective base assembly, transfer internal components between the defective base assembly and the replacement base assembly one at a time. Unless otherwise noted, install each internal component in the replacement base assembly immediately after removing it from the defective base assembly.

- **Step 1.** Remove any storage drives, optional drive components, and hard disk drive bay fillers from the defective base assembly and set them aside on a static-protective surface. (see “Removing a hot-swap hard disk drive” on page 856).
- **Step 2.** Remove the bezel from the defective base assembly and immediately install it on the replacement base assembly (see “Removing the bezel” on page 833 and “Installing the bezel” on page 834).
  
  **Note:** If your compute node has an RFID tag, it is already attached to the bezel.

- **Step 3.** Remove the covers from both compute nodes (see “Removing the compute node cover” on page 836). Keep the cover that comes with the replacement base assembly for reference and re-install it on the defective base assembly prior to returning the defective base assembly.

- **Step 4.** Remove hard disk drive backplane from the defective base assembly and immediately install it in the replacement base assembly (see “Removing the hard disk drive backplane” on page 853 and “Installing the hard disk drive backplane” on page 855).
  
  **Note:** Install the storage drives in the same bay locations from which they were removed.

- **Step 5.** Install any removed storage drives, optional drive components, and hard disk drive bay fillers into the replacement base assembly (see “Installing a hot-swap hard disk drive” on page 856).

- **Step 6.** Remove the DIMM air baffles from defective base assembly and set them aside.

  **Attention:**
  - Remove and install only one microprocessor at a time.
  - When removing or installing a microprocessor, protect the other microprocessor socket with a microprocessor heat sink filler.
  - When transferring a microprocessor to a replacement base assembly, install the microprocessor heat sink filler in the defective base assembly immediately after installing the microprocessor in the replacement base assembly.

- **Step 7.** Transfer microprocessor 1 (left rear microprocessor) and its heat sink from the defective base assembly to the replacement base assembly. Use the microprocessor installation tool that comes with the replacement base assembly to remove the microprocessor from the defective base assembly and install it immediately in the replacement base assembly.
a. Use a screwdriver to loosen the screw on one side of the heat sink to break the seal with the microprocessor.

b. Use a screwdriver to loosen the screws on the heat sink, rotating each screw two full turns until each screw is loose.

c. Gently pull the heat sink from the microprocessor.

   **Attention:** Do not touch the thermal material on the bottom of the heat sink. Touching the thermal material will contaminate it.

d. Identify which release lever is labeled as the first release lever to open, and open it.

   **Attention:** Do not use any tools or sharp objects to lift the release levers on the microprocessor socket. Doing so might result in permanent damage to the system board.

e. Open the second release lever on the microprocessor socket.

f. Open the microprocessor retainer.

g. Select the empty installation tool and ensure that the handle is in the open position. If the installation tool handle is not in the open position, use the following instructions for your installation tool:

   - If using Installation Tool A, twist the microprocessor installation tool handle counterclockwise to the open position.

   - If using Installation Tool B, 1) lift the interlock latch and hold it up while you 2) twist the microprocessor installation tool handle counterclockwise to the open position, and then release the interlock latch. The following illustration of the installation tool shows the location of the interlock latch and counterclockwise rotation of the handle before loading the microprocessor.
h. Align the installation tool with the screws, as shown in the following graphic, and lower the installation tool on the microprocessor. The installation tool rests flush on the socket only when it is aligned correctly.

i. Using the following instructions for your installation tool, remove the microprocessor.
   - If using Installation Tool A, gently twist the handle clockwise to the closed position and lift the microprocessor out of the socket.
   - If using Installation Tool B, gently twist the handle of the installation tool clockwise until it locks in the “H” or “L” position, depending on the size of microprocessor, and then lift the microprocessor out of the socket.
Attention: Do not touch the connectors on the microprocessor and the microprocessor socket.

j. Open the packaging that contains the new microprocessor installation tool assembly and carefully remove the installation tool assembly from the package.

Note: Do not touch the microprocessor contacts. Contaminants on the microprocessor contacts, such as oil from your skin, can cause connection failures between the contacts and the socket.

k. Remove the microprocessor protective cover if one is present.

l. Align the installation tool with the microprocessor socket. The installation tool rests flush on the socket only if it is properly aligned.
m. Install the microprocessor using the following instructions for your installation tool.

- If using Installation Tool A, twist the handle on the microprocessor tool assembly counterclockwise to the open position to insert the microprocessor into the socket, and lift the installation tool out of the socket.

- If using Installation Tool B, twist the handle of the installation tool assembly counterclockwise until the microprocessor is inserted into the socket, and lift the installation tool out of the socket. The following illustration shows the tool handle in the open position.

Attention:

- Do not press the microprocessor into the socket.
- Make sure that the microprocessor is aligned correctly in the socket before you try to close the microprocessor retainer.
- Do not touch the thermal grease on the bottom of the heat sink or on top of the microprocessor. Touching the thermal grease will contaminate it.
n. Close the microprocessor retainer on the microprocessor socket.
o. Identify which release lever is labeled as the first release lever to close, and close it.
p. Close the second release lever on the microprocessor socket.

Attention:
- If you are installing a new heat sink, do not set down the heat sink after you remove the plastic cover.
- Do not touch the thermal material on the bottom of the heat sink. Touching the thermal material will contaminate it.

Step 8. Repeat step 8 for microprocessors 2, 3 and 4, if installed.
Step 9. Remove all of the installed components in the following list from the defective base assembly; then, immediately install them on the replacement base assembly:
- DIMMs. See “Removing a DIMM” on page 839 and “Installing a DIMM ” on page 840.
- I/O expansion adapters. See “Removing an I/O expansion adapter” on page 857 and “Installing an I/O expansion adapter” on page 858.

Step 10. Install the DIMM air baffles in the replacement base assembly. The DIMM air baffles are required to maintain system cooling.

Note: Retaining clips on the DIMM connectors must be in the closed position to install the air baffles.

Step 11. Install the cover that you removed from the original (defective) base assembly onto the replacement base assembly (see “Installing the compute node cover” on page 838 for instructions).

Important: The heat sink fillers protect the microprocessor sockets from potential damage during shipping.

Step 12. Make sure that all four microprocessor sockets on defective base assembly have heat sink fillers installed; then, install the cover that came with the replacement base assembly onto the defective base assembly (see “Installing the compute node cover” on page 838 for instructions).

Note: Retention clips that secure the I/O expansion adapters must be in the closed position to install the cover.

Step 13. The new base assembly comes with a Repair Identification (RID) tag. Using a ball point pen, transfer the machine type and serial number from the old base assembly to the two labels on the Repair Identification tag; then, place Tag 1 on the label tab (see “Installing a compute node in a
chassis” on page 829) and Tag 2 on the bottom of the compute node. If you installed the new bezel on the new base assembly because the old bezel was damaged and did not transfer the Tag from the old bezel to the new bezel, install Tag 3 on the lower right corner of the new bezel. If you installed the old bezel on the new base assembly or transferred the Tag from the old bezel to the new bezel, discard Tag 3.

After you transfer components to the replacement base assembly, complete the following steps:

1. Install the compute node in the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).

2. Use the CMM Web Interface to restore the IP address of the compute node IMM. See for more information.

   **Note:** If you configured static IP addresses, you will not be able to access the node remotely or from a management device until the IP address of the IMM is restored.

3. Reactivate any Features on Demand features. Instructions for automating the activation of features and installing activation keys is in the Lenovo Features on Demand Users Guide. To download the document, go to [https://fod.lenovo.com/lkms](https://fod.lenovo.com/lkms), log in, and click Help.

4. Update the Universally Unique Identifier (UUID) and DMI/SMBIOS data with new vital product data (VPD). Use the Advanced Settings Utility to update the UUID and DMI/SMBIOS data (see “Updating the Universally Unique Identifier and DMI/SMBIOS data” on page 32).

5. Update the compute node with the latest firmware or restore the preexisting firmware (see “Updating firmware and device drivers” on page 23 for more information).

If you are instructed to return the defective base assembly, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.
Important: Make sure that both heat-sink fillers are installed on the defective base assembly that you are returning, prior to shipment. Use the heat-sink fillers that were removed from the replacement base assembly when you installed the microprocessors. Do not install the microprocessor socket dust covers in the defective base assembly that you are returning.

Removing the chassis bulkhead

Use this information to remove the chassis bulkhead.

Note: This procedure should be performed only by trained service technicians.

Before you remove the chassis bulkhead, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

To remove the chassis bulkhead, complete the following steps.

Step 1. Remove the cover (see “Removing the compute node cover” on page 836).
Step 2. Remove the fabric connector (see “Removing a fabric connector” on page 874).
Step 3. Carefully place the chassis on its side with the front handle side up.

   Note: You might find it helpful to remove the air baffles.

Step 4. Using a T8 Torx screwdriver, remove the screws that secure the bulkhead from the bottom of the chassis.
Step 5. Carefully return the chassis to the bottom-side-down orientation.
Step 6. Using a T8 Torx screwdriver, remove the screws that secure the bulkhead from the sides of the chassis.
Step 7. Lift the chassis bulkhead from the chassis.

If you are instructed to return the chassis bulkhead, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.
Installing the chassis bulkhead

Use this information to install the chassis bulkhead.

**Note:** This procedure should be performed only by trained service technicians.

Before you install the chassis bulkhead, complete the following steps:

1. **Read** “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

To install the chassis bulkhead, complete the following steps.

![Diagram of chassis bulkhead installation](image)

**Step 1.** Remove the cover (see “Removing the compute node cover” on page 836).
**Step 2.** Remove the fabric connector (see “Removing a fabric connector” on page 874).
**Step 3.** Position the bulkhead in the chassis.
**Step 4.** Using a T8 Torx screwdriver, install the screws that secure the bulkhead to the sides of the chassis.
**Step 5.** Carefully place the chassis on its side with the front handle side up.
**Step 6.** Using a T8 Torx screwdriver, install the screws that secure the bulkhead to the bottom of the chassis.
**Step 7.** Carefully return the chassis to the bottom-side-down orientation.
**Step 8.** Install the fabric connector (see “Installing a fabric connector” on page 875).
**Step 9.** Install the air baffles, if you removed them.

**Attention:**
- Install the air baffles with the arrow indicating air airflow direction pointing to the rear of the compute node.
- To maintain proper system cooling, do not operate the compute node without air baffles installed over the DIMM connectors.

After you install the chassis bulkhead, complete the following steps:
1. Install the cover onto the compute node (see “Installing the compute node cover” on page 838 for instructions).

2. Install the compute node into the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).

**Removing the hard disk drive cage**

Use this information to remove the hard disk drive cage.

**Note:** This procedure should be performed only by trained service technicians.

Before you remove the hard disk drive cage, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.

2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).

3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

To remove the hard disk drive cage, complete the following steps.

![Diagram of hard disk drive cage](image)

**Step 1.** Remove the cover (see “Removing the compute node cover” on page 836).

**Step 2.** Remove the hot-swap hard disk drives and hard disk drive bay fillers (see “Removing a hot-swap hard disk drive” on page 856).

**Step 3.** Remove the hard disk drive backplane (see “Removing the hard disk drive backplane” on page 853).

**Step 4.** Using a T8 Torx screwdriver, remove the four screws from the cage and rotate the cage from under the bezel; then, remove the cage from the compute node at an angle.

If you are instructed to return the hard disk drive cage, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

**Installing the hard disk drive cage**

Use this information to install the hard disk drive cage.

**Note:** This procedure should be performed only by trained service technicians.

Before you install the hard disk drive cage, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).

3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

To install the hard disk drive cage, complete the following steps.

![Hard disk drive cage](image)

Step 1. Remove the cover (see “Removing the compute node cover” on page 836).

Step 2. Position the cage in the bezel at an angle and rotate the cage into position on the system board.

Step 3. Align the cage with the screw holes on the system board.

Step 4. Using a T8 Torx screwdriver, install the four screws and secure the cage in the compute node.

Step 5. Install the hard disk drive backplane (see “Installing the hard disk drive backplane” on page 855).

Step 6. Insert the hot-swap hard disk drives and hard disk drive bay fillers (see “Installing a hot-swap hard disk drive” on page 856).

After you install the hard disk drive cage, complete the following steps:

1. Install the cover onto the compute node (see “Installing the compute node cover” on page 838 for instructions).

2. Install the compute node into the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).

### Removing a fabric connector

Use this information to remove a fabric connector.

**Note:** This procedure should be performed only by trained service technicians.

Before you remove the fabric connector, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.

2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).

3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

4. Obtain a #1 Phillips screwdriver.
When you remove the fabric connector, the UEFI firmware holds the Ethernet controller in reset and displays a warning message, if an I/O expansion adapter is not installed in the I/O expansion connector 1 to provide connectivity to the chassis.

To remove a fabric connector, complete the following steps.

![Captive screws](image1)

**Step 1.** Remove the cover (see “Removing the compute node cover” on page 836).

**Step 2.** Locate the fabric connector on the system board.

**Step 3.** Using a #1 Phillips screwdriver, loosen the four captive screws that secure the fabric connector.

**Step 4.** Lift the fabric connector from the system board and store it in a safe place.

If you are instructed to return the fabric connector, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

If you have removed the fabric connector to install an I/O expansion adapter in I/O expansion connector 1, keep the fabric connector in a safe place for future use.

**Installing a fabric connector**

Use this information to install a fabric connector.

**Note:** This procedure should be performed only by trained service technicians.

Before you install a fabric connector, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.

2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).

3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

4. Obtain a #1 Phillips screwdriver.

To install a fabric connector, complete the following steps.
Step 1. Remove the cover (see “Removing the compute node cover” on page 836).

Step 2. Locate the fabric connector (see “System-board layouts” on page 18).

Step 3. Orient the fabric connector on the system board.

Step 4. Using a #1 Phillips screwdriver, tighten the four captive screws to secure the fabric connector.

**Attention:** Make sure that the fabric connector is secure, but do not overtighten the screws, to avoid damaging the connector.

After you install the fabric connector, complete the following steps:

1. Install the cover onto the compute node (see “Installing the compute node cover” on page 838 for instructions).
2. Install the compute node into the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).

**Removing a microprocessor and heat sink**

Use this information to remove a microprocessor and heat sink.

**Note:** This procedure should be performed only by trained service technicians.

Before you remove the microprocessor and heat sink, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

The following notes describe information that you must consider when you remove a microprocessor:

- A socket cover and heat-sink filler or a microprocessor and heat sink must always be installed on microprocessor sockets 1, 3, and 4. Microprocessor socket 2 will only have a socket cover when a microprocessor is not installed. If the compute node has only one microprocessor, it must be installed in microprocessor socket 1.
- The microprocessor installation tool might become worn after several uses. Make sure that the tool can hold the microprocessor securely if you are reusing an existing microprocessor installation tool. Do not return the tool with other parts that you are returning.
• If you are installing a second microprocessor, the option kit comes with a microprocessor installation tool that you must use when you install a microprocessor. The microprocessor installation tool comes with the replacement microprocessor installed on it and a cover over the microprocessor.

• If you are replacing a defective microprocessor, the CRU kit comes with one installation tool with the replacement microprocessor installed on it and a cover over the microprocessor, and one empty installation tool without a cover.

• If you are replacing a defective microprocessor, you must obtain the following items for use during the replacement procedure (see Chapter 5 “Parts listing, Types 7167 and 2590” on page 51):
  – Alcohol wipes
  – Thermal grease

**Note:** Be sure to use the installation tool that comes with your microprocessor installation tool assembly. The tools are similar in function and design, however Tool A has one setting for installing one size of microprocessor, and supports the following families of microprocessors: E5-26xx, E5-46xx. Installation Tool B has two settings for installing two different sizes of microprocessors. The settings that are marked on Tool B are “L” for smaller low core microprocessors, and “H” for larger high core microprocessors. Installation Tool B supports the following families of microprocessors: E5-26xx, E5-46xx, E5-26xx v2, E5-46xx v2.

Microprocessor Installation Tools A and B are shown in the following illustration.

To remove a microprocessor and heat sink, complete the following steps.
Step 1. Remove the cover (see “Removing the compute node cover” on page 836).
Step 2. Locate the microprocessor that is to be removed (see “System-board connectors” on page 18).
Step 3. Remove the heat sink.

Attention: Do not touch the thermal material on the bottom of the heat sink. Touching the thermal material will contaminate it.

a. Use a screwdriver to loosen the screw on one side of the heat sink to break the seal with the microprocessor.

b. Use a screwdriver to loosen the screws on the heat sink, rotating each screw two full turns until each screw is loose.

c. Gently pull the heat sink from the microprocessor.

Attention: Do not use any tools or sharp objects to lift the release levers on the microprocessor socket. Doing so might result in permanent damage to the system board.

Step 4. Open the microprocessor socket release levers and retainer.

a. Identify which release lever is labeled as the first release lever to open, and open it.

b. Open the second release lever on the microprocessor socket.

c. Open the microprocessor retainer.

Attention: Do not touch the connectors on the microprocessor and the microprocessor socket.

Step 5. Remove the microprocessor from the socket.
a. Select the empty installation tool and ensure that the handle is in the open position. If the installation tool handle is not in the open position, use the following instructions for your installation tool:

- If using Installation Tool A, twist the microprocessor installation tool handle counterclockwise to the open position.
- If using Installation Tool B, 1) lift the interlock latch and hold it up while you 2) twist the microprocessor installation tool handle counterclockwise to the open position, and then release the interlock latch. The following illustration of the installation tool shows the location of the interlock latch and counterclockwise rotation of the handle before loading the microprocessor.

![Illustration of installation tool]

b. Align the installation tool with the screws, as shown in the following graphic, and lower the installation tool on the microprocessor. The installation tool rests flush on the socket only when it is aligned correctly.

![Illustration of installation tool and microprocessor]

c. Using the following instructions for your installation tool, remove the microprocessor.

- If using Installation Tool A, gently twist the handle clockwise to the closed position and lift the microprocessor out of the socket.
If using Installation Tool B, gently twist the handle of the installation tool clockwise until it locks in the “H” or “L” position, depending on the size of microprocessor, and then lift the microprocessor out of the socket.

If you are instructed to return the microprocessor and heat sink, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

**Installing a microprocessor and heat sink**

Use this information to install a microprocessor and heat sink.

*Note:* This procedure should be performed only by trained service technicians.

The architecture of the Intel E5-46xx CPU and DMI switching of microprocessor sockets 1 and 2 allow for the processors to be populated as shown in the following figures.
### Table 15. Supported CPU installation combinations

<table>
<thead>
<tr>
<th>Number of microprocessors</th>
<th>Microprocessors socket 1</th>
<th>Microprocessors socket 2</th>
<th>Microprocessors socket 3</th>
<th>Microprocessors socket 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CPU0</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>CPU0</td>
<td>CPU1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>CPU0</td>
<td>CPU1</td>
<td>CPU2</td>
<td>CPU3</td>
</tr>
</tbody>
</table>

**Notes:**

1. CPU0 is the boot strap processor.
2. If a bad processor in microprocessor socket 1 causes the processor installed in microprocessor socket 2 to become the boot strap processor and is subsequently replaced, the processor ordering reverts to the default CPU IDs for the new number of CPUs, because the FPGA would not hold the last CPU ID assignments and “add in” the replaced processor.
3. Three-processor configurations are not supported.
4. A microprocessor failure in a four-processor configuration will result in the system failing down to three functional microprocessors.

The supported microprocessor configurations are shown in the following illustrations.

![Diagram of 1x CPU](image)
Before you install a microprocessor and heat sink, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.
The following notes describe the type of microprocessor that the compute node supports and other information that you must consider when you install a microprocessor:

- This component can be installed as an optional device or as a CRU. The installation procedure is the same for the optional device and the CRU.
- The optional microprocessors are limited by the capacity and capability of the compute node. Any microprocessors that you install must have the same specifications as the microprocessors that came with the compute node.
- A socket cover and heat-sink filler or a microprocessor and heat sink must always be installed on microprocessor sockets 1, 3, and 4. Microprocessor socket 2 will only have a socket cover when a microprocessor is not installed. If the compute node has only one microprocessor, it must be installed in microprocessor socket 1.
- If you are installing a second microprocessor, make sure that the microprocessors are identical.
- Before you install a new microprocessor, download and install the most current level of UEFI code (see “Updating firmware and device drivers” on page 23).
- When you install a second microprocessor, you might have to install additional memory or redistribute memory across the DIMM connectors. See “Installing a DIMM” on page 840.
- The microprocessor installation tool might become worn after several uses. Make sure that the tool can hold the microprocessor securely if you are reusing an existing microprocessor installation tool. Do not return the tool with other parts that you are returning.
- If you are installing a second microprocessor, the microprocessor option kit comes with a microprocessor installation tool that you must use when you install a microprocessor. The microprocessor installation tool comes with the replacement microprocessor installed on it and a cover over the microprocessor.
- If you are replacing a defective microprocessor, the CRU kit comes with one installation tool with the replacement microprocessor installed on it and a cover over the microprocessor, and one empty installation tool without a cover.
- If you are replacing a defective microprocessor, you must obtain the following items for use during the replacement procedure (see Chapter 5 “Parts listing, Types 7167 and 2590” on page 51):
  - Alcohol wipes
  - Thermal grease

Attention:

1. Do not use any tools or sharp objects to lift the locking levers on the microprocessor socket. Doing so might result in permanent damage to the system board.

2. Do not touch the contacts in the microprocessor socket. Touching these contacts might result in permanent damage to the system board.

Note: Be sure to use the installation tool that comes with your microprocessor installation tool assembly. The tools are similar in function and design, however Tool A has one setting for installing one size of microprocessor, and supports the following families of microprocessors: E5-26xx, E5-46xx. Installation Tool B has two settings for installing two different sizes of microprocessors. The settings that are marked on Tool B are “L” for smaller low core microprocessors, and “H” for larger high core microprocessors. Installation Tool B supports the following families of microprocessors: E5-26xx, E5-46xx, E5-26xx v2, E5-46xx v2.

Microprocessor Installation Tools A and B are shown in the following illustration.
To install a microprocessor and heat sink, complete the following steps.

Step 1. Remove the cover (see “Removing the compute node cover” on page 836).

Step 2. If you are not installing a new microprocessor and a new heat sink, remove the thermal grease from the heat sink and microprocessor; then, apply new thermal grease before installation (see “Thermal grease” on page 888).

Step 3. Remove the heat-sink filler, if one is present.

Step 4. Open the microprocessor socket release levers and retainer.
a. Identify which release lever is labeled as the first release lever to open and open it.
b. Open the second release lever on the microprocessor socket.
c. Open the microprocessor retainer.

Step 5. Install the microprocessor in the microprocessor socket.

a. Open the packaging that contains the new microprocessor installation tool assembly and carefully remove the installation tool assembly from the package.

  **Note:** Do not touch the microprocessor contacts. Contaminants on the microprocessor contacts, such as oil from your skin, can cause connection failures between the contacts and the socket.

b. Remove the microprocessor protective cover if one is present.
c. Align the installation tool with the microprocessor socket. The installation tool rests flush on the socket only if it is properly aligned.

d. Install the microprocessor using the following instructions for your installation tool.
• If using Installation Tool A, twist the handle on the microprocessor tool assembly counterclockwise to the open position to insert the microprocessor into the socket, and lift the installation tool out of the socket.

• If using Installation Tool B, twist the handle of the installation tool assembly counterclockwise until the microprocessor is inserted into the socket, and lift the installation tool out of the socket. The following illustration shows the tool handle in the open position.

Attention:
• Do not press the microprocessor into the socket.
• Make sure that the microprocessor is aligned correctly in the socket before you try to close the microprocessor retainer.
• Do not touch the thermal grease on the bottom of the heat sink or on top of the microprocessor. Touching the thermal grease will contaminate it.

Step 6. Close the microprocessor socket release retainer and levers.

a. Close the microprocessor retainer on the microprocessor socket.
b. Identify which release lever is labeled as the first release lever to close, and close it.
c. Close the second release lever on the microprocessor socket.
d. If a socket cover is installed over the microprocessor retainer, it is released as you close the retainer. Remove the socket cover from the compute node and store it in a safe place.
Attention:

- If you are installing a new heat sink, do not set down the heat sink after you remove the plastic cover.
- Do not touch the thermal material on the bottom of the heat sink. Touching the thermal material will contaminate it.

Step 7. If you are installing a new heat sink, remove the plastic protective cover from the bottom of the heat sink. If you are reinstalling a heat sink that you previously removed from the compute node, make sure that the thermal material is still on the bottom of the heat sink and on the top of the microprocessor.

a. Position the heat sink over the microprocessor. The heat sink is keyed to assist with proper alignment.

b. Align and place the heat sink on top of the microprocessor in the retention bracket, thermal material side down.

c. Press firmly on the heat sink.

d. Align the screws on the heat sink with the holes on the heat-sink retention module.

e. Press firmly on the captive screws and tighten them with a screwdriver, alternating among the screws until they are tight. If possible, each screw should be rotated two full rotations at a time. Repeat until the screws are tight. Do not overtighten the screws by using excessive force. If you are using a torque wrench, tighten the screws to 0.9 Newton-meters (Nm) to 1.13 Nm (8 inch-pounds to 10 inch-pounds).

After you install a microprocessor and heat sink, complete the following steps:

1. Install the cover (see “Installing the compute node cover” on page 838).

2. Install the compute node in a Flex System chassis (see “Installing a compute node in a chassis” on page 829 for instructions).

Thermal grease

Use this information to determine the guidelines for using thermal grease on a heat sink and microprocessor.

Note: This procedure should be performed only by trained service technicians.

The thermal grease must be replaced whenever the heat sink has been removed from the top of the microprocessor and is going to be reused or when debris is found in the grease.

To replace damaged or contaminated thermal grease on the microprocessor and heat sink, complete the following steps:

Step 1. Place the heat-sink assembly on a clean work surface.

Step 2. Remove the cleaning pad from its package and unfold it completely.

Step 3. Use the cleaning pad to wipe the thermal grease from the bottom of the heat sink.

Note: Make sure that all of the thermal grease is removed.

Step 4. Use a clean area of the cleaning pad to wipe the thermal grease from the microprocessor; then, dispose of the cleaning pad after all of the thermal grease is removed.
Step 5. Use the thermal-grease syringe to place nine uniformly spaced dots of 0.02 mL each on the top of the microprocessor.

**Note:** 0.01 mL is one tick mark on the syringe. If the grease is properly applied, approximately half (0.22 mL) of the grease will remain in the syringe.

Step 6. Continue with the microprocessor installation instructions in “Installing a microprocessor and heat sink” on page 880.

**Removing a microprocessor-retention assembly**

Use this information to remove a microprocessor-retention assembly.

**Note:** This procedure should be performed only by trained service technicians.

Before you remove the microprocessor-retention assembly, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

To remove a microprocessor-retention assembly, complete the following steps.
Step 1. Remove the cover (see “Removing the compute node cover” on page 836).
Step 2. Locate the microprocessor socket on the system board.
Step 3. If a microprocessor and heat sink are installed, remove them (see “Removing a microprocessor and heat sink” on page 876).
Step 4. Remove the heat-sink key from the microprocessor-retention assemblies and store it in a safe place.
Step 5. Make sure that the microprocessor socket release levers are in the open position.
Step 6. Using a T20 Torx screwdriver, remove the four screws that secure the microprocessor-retention assembly.

Attention:
1. Do not allow the microprocessor-retention assembly to touch the microprocessor socket. Doing so might result in permanent damage to the system board.
2. Do not touch the contacts in the microprocessor socket. Touching these contacts might result in permanent damage to the system board.
Step 7. Lift the microprocessor-retention assembly from the system board.

If you are instructed to return the microprocessor-retention assembly, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing a microprocessor-retention assembly

Use this information to install a microprocessor-retention assembly.

Note: This procedure should be performed only by trained service technicians.

Before you install a microprocessor-retention assembly, complete the following steps:

1. Read “Safety” on page iii and “Installation guidelines” on page 827.
2. If the compute node is installed in a Flex System chassis, remove it (see “Removing a compute node from a chassis” on page 828 for instructions).
3. Carefully lay the compute node on a flat, static-protective surface, orienting the compute node with the bezel pointing toward you.

To install a microprocessor-retention assembly, complete the following steps.

Step 1. Remove the cover (see “Removing the compute node cover” on page 836).
Step 2. Make sure that the microprocessor socket release levers are in the open position.

Step 3. Align the microprocessor-retention assembly on the system board.

**Attention:**

1. Do not allow the microprocessor-retention assembly to touch the microprocessor socket. Doing so might result in permanent damage to the system board.
2. Do not touch the contacts in the microprocessor socket. Touching these contacts might result in permanent damage to the system board.

Step 4. Using a T20 Torx screwdriver, install the four screws to secure the microprocessor-retention assembly.

Step 5. Install the heat-sink key on the microprocessor retention assemblies.

Step 6. If necessary, install the microprocessor and heat sink (see “Installing a microprocessor and heat sink” on page 880).

After you install the microprocessor-retention assembly, complete the following steps:

1. Install the cover onto the compute node (see “Installing the compute node cover” on page 838 for instructions).
2. Install the compute node into the chassis (see “Installing a compute node in a chassis” on page 829 for instructions).
Appendix A. Getting help and technical assistance

If you need help, service, or technical assistance or just want more information about Lenovo products, you will find a wide variety of sources available from Lenovo to assist you.

Use this information to obtain additional information about Lenovo and Lenovo products, and determine what to do if you experience a problem with your Lenovo system or optional device.

Note: This section includes references to IBM web sites and information about obtaining service. IBM is Lenovo’s preferred service provider for the System x, Flex System, and NeXtScale System products.

Before you call

Before you call, make sure that you have taken these steps to try to solve the problem yourself.

If you believe that you require warranty service for your Lenovo product, the service technicians will be able to assist you more efficiently if you prepare before you call.

- Check all cables to make sure that they are connected.
- Check the power switches to make sure that the system and any optional devices are turned on.
- Check for updated software, firmware, and operating-system device drivers for your Lenovo product. The Lenovo Warranty terms and conditions state that you, the owner of the Lenovo product, are responsible for maintaining and updating all software and firmware for the product (unless it is covered by an additional maintenance contract). Your service technician will request that you upgrade your software and firmware if the problem has a documented solution within a software upgrade.
- If you have installed new hardware or software in your environment, check http://www.lenovo.com/serverproven/ to make sure that the hardware and software is supported by your product.
- Go to http://www.lenovo.com/support to check for information to help you solve the problem.
- Gather the following information to provide to the service technician. This data will help the service technician quickly provide a solution to your problem and ensure that you receive the level of service for which you might have contracted.
  - Hardware and Software Maintenance agreement contract numbers, if applicable
  - Machine type number (Lenovo 4-digit machine identifier)
  - Model number
  - Serial number
  - Current system UEFI and firmware levels
  - Other pertinent information such as error messages and logs
- Go to http://www.ibm.com/support/entry/portal/Open_service_request to submit an Electronic Service Request. Submitting an Electronic Service Request will start the process of determining a solution to your problem by making the pertinent information available to the service technicians. The IBM service technicians can start working on your solution as soon as you have completed and submitted an Electronic Service Request.

You can solve many problems without outside assistance by following the troubleshooting procedures that Lenovo provides in the online help or in the Lenovo product documentation. The Lenovo product documentation also describes the diagnostic tests that you can perform. The documentation for most systems, operating systems, and programs contains troubleshooting procedures and explanations of error messages and error codes. If you suspect a software problem, see the documentation for the operating system or program.
Using the documentation

Information about your Lenovo system and preinstalled software, if any, or optional device is available in the product documentation. That documentation can include printed documents, online documents, readme files, and help files.

See the troubleshooting information in your system documentation for instructions for using the diagnostic programs. The troubleshooting information or the diagnostic programs might tell you that you need additional or updated device drivers or other software. Lenovo maintains pages on the World Wide Web where you can get the latest technical information and download device drivers and updates. To access these pages, go to http://www.lenovo.com/support.

Getting help and information from the World Wide Web

Up-to-date information about Lenovo products and support is available on the World Wide Web.

On the World Wide Web, up-to-date information about Lenovo systems, optional devices, services, and support is available at http://www.lenovo.com/support. The most current version of the product documentation is available in the following product-specific Information Centers:

How to send DSA data

You can use the Enhanced Customer Data Repository to send diagnostic data to IBM.

You can use any of the following methods to send diagnostic data:

- **Standard upload with the system serial number:** [http://www.ecurep.ibm.com/app/upload_hw](http://www.ecurep.ibm.com/app/upload_hw)
- **Secure upload:** [http://www.ibm.com/de/support/ecurep/send_http.html#secure](http://www.ibm.com/de/support/ecurep/send_http.html#secure)
- **Secure upload with the system serial number:** [https://www.ecurep.ibm.com/app/upload_hw](https://www.ecurep.ibm.com/app/upload_hw)

Creating a personalized support web page

You can create a personalized support web page by identifying Lenovo products that are of interest to you.

To create a personalized support web page, go to [http://www.ibm.com/support/mynotifications](http://www.ibm.com/support/mynotifications). From this personalized page, you can subscribe to weekly email notifications about new technical documents, search for information and downloads, and access various administrative services.

Software service and support

Through IBM Support Line, you can get telephone assistance, for a fee, with usage, configuration, and software problems with your Lenovo products.
Hardware service and support

IBM is Lenovo’s preferred service provider for the System x, Flex System and NeXtScale System products.

You can receive hardware service through your Lenovo reseller or from IBM. To locate a reseller authorized by Lenovo to provide warranty service, go to http://www.ibm.com/partnerworld and click Business Partner Locator. For IBM support telephone numbers, see http://www.ibm.com/planetwide. In the U.S. and Canada, call 1-800-IBM-SERV (1-800-426-7378).

In the U.S. and Canada, hardware service and support is available 24 hours a day, 7 days a week. In the U.K., these services are available Monday through Friday, from 9 a.m. to 6 p.m.

Taiwan product service

Use this information to contact product service for Taiwan.

Appendix B. Notices

Lenovo may not offer the products, services, or features discussed in this document in all countries. Consult your local Lenovo representative for information on the products and services currently available in your area.

Any reference to a Lenovo product, program, or service is not intended to state or imply that only that Lenovo product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any Lenovo intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any other product, program, or service.

Lenovo may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document is not an offer and does not provide a license under any patents or patent applications. You can send inquiries in writing to the following:

Lenovo (United States), Inc.

Some jurisdictions do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. Lenovo may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

The products described in this document are not intended for use in implantation or other life support applications where malfunction may result in injury or death to persons. The information contained in this document does not affect or change Lenovo product specifications or warranties. Nothing in this document shall operate as an express or implied license or indemnity under the intellectual property rights of Lenovo or third parties. All information contained in this document was obtained in specific environments and is presented as an illustration. The result obtained in other operating environments may vary.

Lenovo may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Any references in this publication to non-Lenovo Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this Lenovo product, and use of those Web sites is at your own risk.

Any performance data contained herein was determined in a controlled environment. Therefore, the result obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Trademarks

Lenovo, the Lenovo logo, Flex System, System x, NeXtScale System, and x Architecture are trademarks of Lenovo in the United States, other countries, or both.

Intel and Intel Xeon are trademarks of Intel Corporation in the United States, other countries, or both.

Internet Explorer, Microsoft, and Windows are trademarks of the Microsoft group of companies.

Linux is a registered trademark of Linus Torvalds.

Other company, product, or service names may be trademarks or service marks of others.

Important notes

Processor speed indicates the internal clock speed of the microprocessor; other factors also affect application performance.

CD or DVD drive speed is the variable read rate. Actual speeds vary and are often less than the possible maximum.

When referring to processor storage, real and virtual storage, or channel volume, KB stands for 1,024 bytes, MB stands for 1,048,576 bytes, and GB stands for 1,073,741,824 bytes.

When referring to hard disk drive capacity or communications volume, MB stands for 1,000,000 bytes, and GB stands for 1,000,000,000 bytes. Total user-accessible capacity can vary depending on operating environments.

Maximum internal hard disk drive capacities assume the replacement of any standard hard disk drives and population of all hard-disk-drive bays with the largest currently supported drives that are available from Lenovo.

Maximum memory might require replacement of the standard memory with an optional memory module.

Each solid-state memory cell has an intrinsic, finite number of write cycles that the cell can incur. Therefore, a solid-state device has a maximum number of write cycles that it can be subjected to, expressed as total bytes written (TBW). A device that has exceeded this limit might fail to respond to system-generated commands or might be incapable of being written to. Lenovo is not responsible for replacement of a device that has exceeded its maximum guaranteed number of program/erase cycles, as documented in the Official Published Specifications for the device.

Lenovo makes no representations or warranties with respect to non-Lenovo products. Support (if any) for the non-Lenovo products is provided by the third party, not Lenovo.

Some software might differ from its retail version (if available) and might not include user manuals or all program functionality.

Recycling information

Lenovo encourages owners of information technology (IT) equipment to responsibly recycle their equipment when it is no longer needed. Lenovo offers a variety of programs and services to assist equipment owners in recycling their IT products. For information on recycling Lenovo products, go to: http://www.lenovo.com/recycling.
Particulate contamination

**Attention:** Airborne particulates (including metal flakes or particles) and reactive gases acting alone or in combination with other environmental factors such as humidity or temperature might pose a risk to the device that is described in this document.

Risks that are posed by the presence of excessive particulate levels or concentrations of harmful gases include damage that might cause the device to malfunction or cease functioning altogether. This specification sets forth limits for particulates and gases that are intended to avoid such damage. The limits must not be viewed or used as definitive limits, because numerous other factors, such as temperature or moisture content of the air, can influence the impact of particulates or environmental corrosives and gaseous contaminant transfer. In the absence of specific limits that are set forth in this document, you must implement practices that maintain particulate and gas levels that are consistent with the protection of human health and safety. If Lenovo determines that the levels of particulates or gases in your environment have caused damage to the device, Lenovo may condition provision of repair or replacement of devices or parts on implementation of appropriate remedial measures to mitigate such environmental contamination. Implementation of such remedial measures is a customer responsibility.

**Table 16. Limits for particulates and gases**

<table>
<thead>
<tr>
<th>Contaminant</th>
<th>Limits</th>
</tr>
</thead>
</table>
| Particulate | • The room air must be continuously filtered with 40% atmospheric dust spot efficiency (MERV 9) according to ASHRAE Standard 52.2<sup>1</sup>.  
• Air that enters a data center must be filtered to 99.97% efficiency or greater, using high-efficiency particulate air (HEPA) filters that meet MIL-STD-282.  
• The deliquescent relative humidity of the particulate contamination must be more than 60%<sup>2</sup>.  
• The room must be free of conductive contamination such as zinc whiskers. |
| Gaseous     | • Copper: Class G1 as per ANSI/ISA 71.04-1985<sup>3</sup>  
• Silver: Corrosion rate of less than 300 Å in 30 days |

<sup>2</sup> The deliquescent relative humidity of particulate contamination is the relative humidity at which the dust absorbs enough water to become wet and promote ionic conduction.

Telecommunication regulatory statement

This product may not be certified in your country for connection by any means whatsoever to interfaces of public telecommunications networks. Further certification may be required by law prior to making any such connection. Contact a Lenovo representative or reseller for any questions.
Electronic emission notices

When you attach a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices that are supplied with the monitor.

Federal Communications Commission (FCC) statement

Note: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Lenovo is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user’s authority to operate the equipment.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that might cause undesired operation.

Industry Canada Class A emission compliance statement

This Class A digital apparatus complies with Canadian ICES-003.

Avis de conformité à la réglementation d'Industrie Canada

Cet appareil numérique de la classe A est conforme à la norme NMB-003 du Canada.

Australia and New Zealand Class A statement

Attention: This is a Class A product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.

European Union EMC Directive conformance statement

This product is in conformity with the protection requirements of EU Council Directive 2014/30/EU on the approximation of the laws of the Member States relating to electromagnetic compatibility. Lenovo cannot accept responsibility for any failure to satisfy the protection requirements resulting from a non-recommended modification of the product, including the installation of option cards from other manufacturers.

This product has been tested and found to comply with the limits for Class A equipment according to European Standards harmonized in the Directives in compliance. The limits for Class A equipment were derived for commercial and industrial environments to provide reasonable protection against interference with licensed communication equipment.

Lenovo, Einsteinova 21, 851 01 Bratislava, Slovakia

Warning: This is a Class A product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.
Germany Class A statement

Deutschsprachiger EU Hinweis: Hinweis für Geräte der Klasse A EU-Richtlinie zur Elektromagnetischen Verträglichkeit

Deutschland:

Dieses Gerät ist berechtigt, in Übereinstimmung mit dem Deutschen EMVG das EG-Konformitätszeichen - CE - zu führen. Verantwortlich für die Konformitätserklärung nach Paragraf 5 des EMVG ist die Lenovo (Deutschland) GmbH, Meitnerstr. 9, D-70563 Stuttgart.

Informationen in Hinsicht EMVG Paragraf 4 Abs. (1) 4: Das Gerät erfüllt die Schutzanforderungen nach EN 55024 und EN 55032 Klasse A.

Nach der EN 55032: „Dies ist eine Einrichtung der Klasse A. Diese Einrichtung kann im Wohnbereich Funkstörungen verursachen; in diesem Fall kann vom Betreiber verlangt werden, angemessene Maßnahmen durchzuführen und dafür aufzukommen."

Anmerkung: Um die Einhaltung des EMVG sicherzustellen sind die Geräte, wie in den Handbüchern angegeben, zu installieren und zu betreiben.
Japanese electromagnetic compatibility statements

Japan VCCI Class A statement

この装置は、クラスA情報技術装置です。この装置を家庭環境で使用すると電波障害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。

Korea Communications Commission (KCC) statement

이 기기는 업무용(A급)으로 전자파적합기기로 가정외의 지역에서 사용하는 것을 목적으로 합니다.

This is electromagnetic wave compatibility equipment for business (Type A). Sellers and users need to pay attention to it. This is for any areas other than home.

Russia Electromagnetic Interference (EMI) Class A statement

ВНИМАНИЕ!
Настоящее изделие относится к оборудованию класса A. При использовании в бытовой обстановке это оборудование может нарушать функционирование других технических средств в результате создаваемых индустриальных радиопомех. В этом случае от пользователя может потребоваться принятие адекватных мер.
